#### **BEFORE THE**

#### RHODE ISLAND PUBLIC UTILITY COMMISSION

#### DOCKET NO. 4185

REVIEW OF THE AMENDED POWER PURCHASE AGREEMENT BETWEEN NARRAGANSETT ELECTRIC D/B/A NATIONAL GRID AND DEEPWATER WIND BLOCK ISLAND, LLC PURSUANT TO R.I.G.L § 39-26.1-7

DIRECT TESTIMONY

OF

#### ROBERT McCULLOUGH

#### ON BEHALF OF THE CITIZEN INTERVENERS GROUP

July 20, 2010

#### 1 Q. Please identify yourself for the record.

A. My name is Robert McCullough. I am the Managing Partner of McCullough Research, 6123 S.E.
 Reed College Place, Portland, Oregon 97202.

#### 4 Q. On whose behalf are you testifying?

5 A. The Citizen Interveners Group.

#### 6 Q. Can you summarize your experience and qualifications?

7 Yes. I have been active in the electricity business for the past thirty years. I started as a Α. 8 manager for rates in 1979 at Portland General Electric. Over the next decade I was steadily 9 promoted until I reached the rank of Vice President in PGE's power marketing subsidiary. In 10 1991 I left PGE to found McCullough Research, a consulting firm concentrating on bulk power issues. Over the last twenty years I have advised energy buyers, utilities, governments, and 11 12 regulators on energy contracting issues from Quebec to California. My testimony at the U.S. 13 Senate concerning Enron's energy trading in 2002 initiated the investigation of its trading 14 practices by FERC, the CFTC, and the U.S. Department of Justice. We worked for the DOJ in the 15 course of the Enron prosecutions. We also worked for the state attorney generals of California, Oregon, and Montana on related issues. 16

#### 17 Q. What is your background on energy contracts and procurement?

- A. Extensive. I have advised utilities, companies, and governments about power supply issues in
   jurisdictions across the U.S. and Canada. My detailed curriculum vita is attached as Exhibit RM-1
   to this testimony.
- 21 Q. What is the purpose of your testimony in this proceeding?
- A. The Citizen Interveners Group asked me to review the National Grid Deepwater Wind
   transaction for consistency with the "commercially reasonable" standard as set out in R.I.G.L §
   39-26.1-7.
- 25 Q. What does the recently enacted statute say about "commercially reasonable"?
- 26 A. The statute states:
- (c) The commission shall review the amended power purchase agreement taking
  into account the state's policy intention to facilitate the development of a small
  offshore wind project in Rhode Island waters, while at the same time
  interconnecting Block Island to the mainland. The commission shall review the
  amended power purchase agreement and shall approve it if:

- 1(i) The amended agreement contains terms and conditions that are<br/>commercially reasonable;3The statute further clarifies the definition of "commercially reasonable" in Section (c)(iv):
- Notwithstanding any other provisions of the general laws to the contrary, for
  the purposes of this section, "commercially reasonable" shall mean terms and
  pricing that are reasonably consistent with what an experienced power market
  analyst would expect to see for a project of a similar size, technology and
  location, and meeting the policy goals in subsection (a) of this section.
- 9 Q. How did you approach this evaluation?
- A. I approached this as a standard business review. I asked how reasonable the pricing was, how
   well documented the product was, and how well the transaction was written down.

#### 12 Q. Can you characterize your conclusions?

If I had been retained to evaluate the transaction for either Deepwater Wind or National Grid I 13 Α. 14 would recommend substantial changes. The price for Deepwater Wind is high – significantly higher than similar projects recently completed or currently underway in Europe.<sup>1</sup> Our 15 knowledge of what we are actually purchasing is limited.<sup>2</sup> The cost figures give the appearance 16 of being reverse engineered from a required rate of return rather than derived from basic 17 engineering estimates.<sup>3</sup> The rate of return seems high with any reasonable level of leverage and 18 due diligence by the purchaser was lacking. Finally, the proposed contract's pricing sections are 19 20 poorly written and several other sections may contain drafting errors.

#### 21 Q. Why do you characterize the contract price as high?

- A. The electric industry in the U.S. has three different standards for evaluating resourceacquisitions. These are:
- 24 1. Fully allocated cost;
- 25 2. Avoided cost;
- 26 3. Competitive market pricing.

<sup>&</sup>lt;sup>1</sup> See, for example, Figure 7 in Support schemes for renewable electricity in the EU, European Commission Economic papers 408, April 2010, reproduced below.

<sup>&</sup>lt;sup>2</sup> See, for example, Deepwater Wind's Response 1-13 to DPU's first request in Docket 4111.

<sup>&</sup>lt;sup>3</sup> See, for example, Deepwater Wind's Response 1-4 to DPU's first request in Docket 4185. The reduction of \$14 million from Docket 4111 expected cost has apparently had no impact on the pricing in Docket 4185.

Docket No. 4185 July 20, 2010

The Deepwater Wind acquisition meets none of these standards. All parties agreed in Docket
 4111 that the price is higher than cost, avoided cost, or market. I can think of no simpler test of
 whether the price is high compared to standard commercial standards.

#### 4 Q. How does the price Deepwater Wind compare against similar projects?

- 5 A. Very poorly. In fact, the price received by Deepwater Wind is considerably above even the 6 comparable project recommended by Deepwater Wind, itself.
- 7 Q. Why do you characterize the purchaser's due diligence as lacking?
- 8 A. The purchaser's responses to interrogatories in this docket speak for themselves:
- 9 While National Grid does not have Deepwater Wind's current financial model, 10 National Grid has reviewed that model with a representative of Deepwater Wind. This review included the cost estimates provided by Deepwater Wind, the 11 12 projected returns for the project, and the bundled energy price (\$/MWh) 13 included in the Amended PPA, to determine that the calculations, including the 14 table in Appendix X, are correct. In that table, the bundled energy price in the 15 December 9, 2009 PPA corresponds to the price if the Total Facility Cost is greater than or equal to the Base Amount; additional costs above the Base 16 17 Amount do not increase the bundled price; and incremental savings below the 18 Base Amount reduce the bundled price. National Grid is not is [sic] a position to 19 review and confirm the elements of cost that are contained in the financial model.<sup>4</sup> 20
- National Grid, the purchaser of the resource, is "not is [sic] a position to review and confirm the
  elements of cost that are contained in the financial model." In any reasonable commercial
  transaction it is appropriate to conduct due diligence on the product being purchased.
- A concern that an "experienced power market analyst" might raise is that the payment that National Grid will receive as part of this transaction has given the wrong incentive – rewarding National Grid for the purchase without exposing National Grid to sufficient risk if the transaction's price is excessive.<sup>5</sup>

#### 28 Q. Are there problems with the contract drafting?

<sup>&</sup>lt;sup>4</sup> Response to Division Data Requests – Set 1, Issued July 6, 2010, response to Request 1-3.

<sup>&</sup>lt;sup>5</sup> R.I.G.L. 39-26.1-4, and State of Rhode Island and Providence Plantations Public Utilities Commission Docket No. 411 Errata Order

Deepwater Indisputably has a great deal at stake, and Grid stands to receive approximately \$19 million in statutorily-authorized "remuneration" payments just for signing the PPA, assuming the Project produces

- A. Yes. The pricing language is opaque and difficult to interpret. In addition, there appears to be
   several substantive errors in the version proposed for approval in the instant hearing. In
   addition, there are minor errors which simply give the impression that the contract has not been
   sufficiently proofed.
- 5 This is an expensive project. Deepwater Wind is new to offshore wind projects. Capitalization 6 and financing is unknown. All these are reasons to make the contract as iron clad as possible.

#### 7 Q. Overall, how would you characterize this contract?

- A. This contract is not commercially reasonable. The prices are high, the due diligence has not
   been completed (perhaps more accurately, even initiated), and the contract has a number of
   serious flaws. If I had been retained by either of the counterparties I would have recommended
   significant changes.
- 12 The scenario is akin to a purchaser buying a house through a real estate agent. The price is 13 higher than comparable transactions, the agent is receiving a commission on the transaction, no 14 inspection of the house has been undertaken, the creditworthiness of the seller is suspect, and 15 the real estate contract is poorly written with a number of obvious errors.

## 16 **Contract Price**

#### 17 Q. Why do we need to review the cost of this project?

A. If National Grid planned to purchase the project and resell it into the market, we would not have
 to review the pricing. National Grid would be taking the risk that the pricing was inappropriate.
 The situation here is very different. As an electric distributor, National Grid is acting as an agent
 for ratepayers and receiving a substantial payment for providing this service. Discovery
 indicates that National Grid has not exercised extensive due diligence in this matter, so it is
 incumbent upon the Commission to protect ratepayers by checking whether this is a
 commercially reasonable – one might even say "prudent" transaction.

#### 25 Q. Is there anything new about this situation?

A. No. This review is built into the very fabric of the traditional utility model. The utility has an
 incentive to build the best possible system since it is remunerated on formulas based on
 investment and expense. Over time we have evolved three different cost standards: fully
 allocated cost, avoided cost, and market pricing.

#### **1** Fully Allocated Costs

#### 2 Q. How did you evaluate this project on a fully allocated cost basis?

A. I would follow the same basic steps as those presented by the Commission staff in Docket 4111.
 Their approach was to question whether the project generated unreasonable rates of return for
 the sponsor. Given the relatively small amount of information on the ownership structure and
 financing, this is not an easy job.

- 7 Q. Who actually owns this project?
- 8 A. Based on the limited information available as of May 14, 2010 approximately three quarters of
   9 Deep Water Wind Holdings, LLC. was beneficially owned by a hedge fund named D. E. Shaw. A
   10 minority of the project is owned by First Wind Holdings, LLC.<sup>6</sup> D. E. Shaw also has a major
   11 ownership position in First Wind Holdings.<sup>7</sup>

#### 12 Q. How does this affect the economics of the project?

Α. Projects like Deep Water Wind are often financed through a framework of special purpose 13 14 entities (SPEs) designed to capture tax benefits and take advantage of leverage. There has been 15 some discussion in Docket 4111 concerning whether Deepwater Wind would have the capability 16 to take advantage of these opportunities. Clearly, its ownership by a major hedge fund with \$21 17 billion in investments and committed capital indicates that the benefits of structured finance are readily available. This is not a small company with limited abilities to approach markets for tax 18 19 monetizations. Since Deepwater Wind Block Island LLC is a tax pass-through entity, any and all 20 of its tax loses and other tax assets are available to its parent, Deepwater Wind Holdings and 21 other tax pass-through affiliates. While this may or may not be the case, Deepwater's parent 22 company, its affiliates, and/or its beneficial owners will be able to do so due to the tax 23 passthrough status of its contract party under the Amended PPA.

#### 24 Q. What capital structure is Deepwater Wind likely to use?

<sup>&</sup>lt;sup>6</sup> Amendment No. 6 to FORM S-1 REGISTRATION STATEMENT UNDER THE SECURITIES ACT OF 1933 of First Wind Holdings Inc., May 14, 2010, page 159.

On May 2, 2008, we received voting interests in Deepwater Wind Holdings, LLC, a wind energy development company focused on developing wind energy projects offshore the continental United States, in exchange for a contribution of \$3.4 million in cash and other assets with a net book value of approximately \$471,000. We and the D. E. Shaw Group currently own approximately 13.6% and 72.1%, respectively, of the outstanding voting interests in Deepwater Wind Holdings, LLC, with the balance of the membership interests held by third-party investors.

<sup>&</sup>lt;sup>7</sup> Ibid., page 7.

1	A.	Discovery indicates that the debt/equity ratio will be on the order of 80/20. <sup>8</sup>								
2	Q.	How does this affect the internal rate of return for the project?								
3 4	A.	If the unleveraged return is higher than the cost of debt, which it is in this case, the financial benefits for the developer are very significant. Let's take a simple example:								
5		Unleveraged return on equity: 1	0.5% <sup>9</sup>							
6		Cost of debt:	5.5% <sup>10</sup>							
7		Leveraged return on equity: 2	6.5% <sup>11</sup>							
8	Q.	Please review Mr. Moore's statement:								
9 10 11 12 13 14		Deepwater Wind believes that the prop appropriate projected rate of return is t return, which does not take into accou consequences, such as tax benefits result do so at this point in time would be a pur is simple. <sup>12</sup>	Deepwater Wind believes that the proper reference point for considering an appropriate projected rate of return is the project-level, or unlevered, rate of return, which does not take into account debt financing and associated tax consequences, such as tax benefits resulting from interest expenses, because to do so at this point in time would be a purely hypothetical exercise. The rationale is simple. <sup>12</sup>							
15		Do you agree with this statement?								
16 17	A.	No, Mr. Moore's statement is particularly iron Investment Tax Credit grant which is apparently d	nic since it is the timing of the Section 48 lictating the schedule for this project. <sup>13</sup>							
18 19 20	Q.	Have you reviewed the testimony of Mr. Pasqu long construction period envisaged for Deepwat equity investor?	alini in his testimony in Docket 4185 that the ter Wind may make it impossible to find a tax							

<sup>&</sup>lt;sup>8</sup> Response to Division Data Requests – Set 1, Issued December 31, 2009, response to Request 1-18.

<sup>&</sup>lt;sup>9</sup> Direct testimony of William H. Moore, Docket 4185, page 14.

<sup>&</sup>lt;sup>10</sup> New York's Offshore Wind Energy Development Potential in the Great Lakes, NYSERDA, April 2010, page 158.

<sup>&</sup>lt;sup>11</sup> Actual ROE = (Unleveraged ROE – 80% x Cost of debt))/20% Equity.

<sup>&</sup>lt;sup>12</sup> William M. Moore Rebuttal Testimony, Docket 4111, Page 1.

<sup>&</sup>lt;sup>13</sup> See for example, his comments on page 10:

Under current rules, wind projects must make certain equipment purchases in 2010 in order to take advantage of the Section 1603 program through 2012. This is Deepwater Wind's current plan, and why it is important to have the PPA approved soon so it can take the next step of making financial commitments on equipment contracts. By doing so, Deepwater Wind will take a step in the direction of ensuring that the Block Island Wind Farm qualifies for this important Federal incentive.

Docket No. 4185 July 20, 2010

A. Yes. In 2007 the Ernest Orlando Lawrence Berkeley National laboratory issued a useful
 monograph on this topic entitled "Wind Project Financing Structures: A Review & Comparative
 Analysis."<sup>14</sup> It provides a very cogent introduction for seven models of structured financing
 vehicles for wind power. The monograph has a variety of decision matrices (shown below) to
 guide prospective developers and their financial advisors through various options:<sup>15</sup>

Most suitable financing strategy or structure:	Project already exists (refinancing / acquisition)	Project has low projected IRR	Developer wants early cash distributions	Developer wants to retain stake in project ownership / ongoing cash flows	Developer can use Tax Benefits Developer can fund project costs		Scenario
Sell project to a Strategic Investor	No	N/A	Yes	No	No	No	1
Corporate	No	No	No	Yes	Yes	Yes	2
Strategic Investor Flip	No	No	No	Yes	Limited	No	3
Institutional Investor Flip	No	No	Yes	Yes	Limited	No	4
Cash Leveraged or Cash & PTC Leveraged	No	Yes	No	Yes	Limited	No	5
Institutional Investor Flip	Yes	No	Yes	Yes	Limited	No	6
Pay-As-You-Go	Yes	N/A	Yes	Yes	Yes	No	7
Back Leveraged	No	Yes	Yes	Yes	Limited	No	8

6

7

8

The timing of construction does not appear in this matrix, nor has the timing of construction appeared in discussions I personally have been involved in other projects.

9 Q. Has Deepwater Wind or its owners explained their financing plan in any detail?

10 A. No.

11 Q. Can you describe your recommendation on the basis of fully allocated costs?

- A. This is not a commercially reasonable transaction. Basic questions first asked in the RFP have
   not been answered. In the next section I note three areas where questions were answered, the
   answers themselves are in flux.
- 15 Avoided Costs
- 16 Q. Should the evaluation of this project have been subject to National Grid's avoided cost filings?

<sup>&</sup>lt;sup>14</sup> Wind Project Financing Structures: A Review & Comparative Analysis, John P. Harper, Birch Tree Capital, LLC Matthew D. Karcher, Deacon Harbor Financial, L.P. Mark Bolinger, Lawrence Berkeley National Laboratory, September 2007.

<sup>&</sup>lt;sup>15</sup> Ibid., page 37, for example.

1 2 3 4	Α.	Yes. This has been the standard for resource acquisition by utilities since 1979. The strongest argument for PURPA (Public Utility Regulatory Policies Act) pricing is that it is a level playing field. If National Grid actually felt that this was a commercially reasonable transaction, they would have allowed a variety of alternatives to be brought forward – not just one.
5	Q.	How does this compare to National grid's filed avoided costs?
6 7	A.	Deepwater Wind's price is very high compared to the avoided costs filed by National Grid in New York, New England, and Rhode Island:
8 9 10 11		(1) <u>Rhode Island Narragansett Electric Company d/b/a National Grid</u> : "Company will pay rates equal to the payments received by the Company for the sale of such qualifying facilities' output into the ISO-NE administered markets for the hours in which the qualifying facility generated electricity in excess of its requirements." <sup>16</sup>
12		Effective Date: September 14, 2009
13 14		(2) <u>New York Niagara Mohawk Power Corporation d/b/a National Grid</u> : Energy: NYISO Real-Time Generator Bus LBMP * Quantity - Incurred Costs ("NYISO
15		Automatic Generation Control Penalties")
16 17		Energy + Capacity: (NYISO RT LBMP * Quantity - Incurred Costs) + (Monthly LBMCP * Monthly Capacity) <sup>17</sup>
18		Effective Date: April 27, 2009
19		(3) Massachusetts Massachusetts Electric Company d/b/a National Grid:
20		Company will pay "rates equal to the payments received by the Company from the ISO
21 22		power exchange for such output for the hours in which the QF generated electricity in excess of its requirements." <sup>18</sup>
23		Effective Date: May 1, 2001
24		(4) Massachusetts Nantucket Electric Company d/b/a National Grid:
25		Company will pay "rates equal to the payments received by the Company from the ISO
26 27		power exchange for such output for the hours in which the QF generated electricity in excess of its requirements." <sup>19</sup>

 <sup>&</sup>lt;sup>16</sup> Narragansett Electric Company Rates Tariff, R.I.P.U.C No. 2035.
 <sup>17</sup> Niagara Mohawk Power Corporation Rates Tariff (PSC No: 220), Service Classification No. 6.
 <sup>18</sup> Massachusetts Electric Company Rates Tariff, M.D.T.E. No. 1032-C.
 <sup>19</sup> Nantucket Electric Company Rates Tariff, M.D.T.E. No. 1032-C.

Docket No. 4185 July 20, 2010

1	Effective Date: May 1, 2001									
2	(5) <u>New Hampshire Granite</u>	(5) New Hampshire Granite State Electric Company d/b/a National Grid:								
3	Energy Rates by Voltage Leve	l (cents/kWh): <sup>20</sup>								
4	Voltage Level	Peak Period	Off-Peak Perio	d Average						
5	(1) Subtransmission	3.697	2.965	3.303						
6	(2) Primary Distribution	3.971	3.111	3.508						
7	(3) Secondary Distribution	4.111	3.184	3.612						
8	Capacity Rates by Voltage Lev	vel:								
9	Voltage Level	\$/kW Year	\$/kW Mon	th						
10	(1) Subtransmission	\$27.80	\$2.32							
11	(2) Primary Distribution	\$30.44	\$2.54							
12	(3) Secondary Distribution	\$31.84	\$2.65							
13	Effective Date: January 1, 199	98								

- 14 Q. Are these close to the prices asked under this contract?
- A. No. There is a large disparity between prices in this contract and the avoided costs filed byNational Grid.
- 17 Market Pricing
- 18 Q. What are comparable market prices to this project?
- A. This is a very interesting question. Unlike Western Europe, the United States and Canada
   occupy a vast continent with immense wind potential. Logically, the best locations would be
   developed first. Since off-shore wind costs over twice that of land based wind and this project
   costs three to four times comparable land based projects market forces have not rushed
   towards off-shore projects.

#### 24 Q. Are there any comparable projects?

A. There are a number of comparable projects identified in the NYSERDA study published this
 spring.<sup>21</sup> A number of parties in Docket 4111 as well as the instant docket have cited Table 10.1
 on page 153:

<sup>&</sup>lt;sup>20</sup> Granite State Electric Company Rates Tariff, N.H.P.U.C. No. 17

#### Docket No. 4185

July 20, 2010

Project Name	Country	Status	Operating	Project Cost	Project Capacity	Project Cost per	No.	Turbine Size	Turbine Model	Water	Distance from Shore

Sheringham Shoal	United Kingdom	Financing secured	2012	\$ 1,500	316.8	\$ 4.73	88	3.6	Siemens 3.6	16 to 22	17 to 23

I have highlighted the project Mr. David Nickerson has argued is the most similar to Deepwater Wind:

4 The most similar project in this group is a German project called Alpha Ventus 5 that reached full commercial operation in April 2010. It is a demonstration 6 project consisting of twelve, 5 MW wind turbines from two different turbine 7 vendors. Six of the twelve turbine foundations are the jacket type that are likely to be used for the Block Island Wind Farm. I consider this to be similar in 8 "technology", with one necessary adjustment, which is described later. The 9 10 project is located in water 30 meters deep - effectively the same "location" as the Block Island Wind Farm. Only the "size" at 60 MW is different. However, it is 11 the closest project in size in the data set.<sup>22</sup> 12

#### 13 Q. Why has Mr. Nickerson singled out Alpha Ventus?

14 A. He states:

1

2 3

<sup>&</sup>lt;sup>21</sup> New York's Offshore Wind Energy Development Potential in the Great Lakes: Feasibility Study, NYSERDA, April 2010.

<sup>&</sup>lt;sup>22</sup> Direct testimony of David Nickerson, Docket 4185, July 15, 2010. Pages 5 and 6.

1 The primary focus of my analysis is on installed cost, expressed in dollars per 2 kilowatt (\$/kW) of nameplate capacity. As I discussed in Docket 4111, a review 3 of the key cost elements that impact the price and price structure in a long term 4 PPA indicate whether the PPA pricing is reasonable and consistent with 5 expectations. For offshore wind, the key cost elements are installed costs, 6 ongoing operations and maintenance costs, and cost of capital (rate of return). 7 If each of these underlying elements is reasonable, then it is consistent to 8 conclude that the PPA pricing and the associated payment stream over time is 9 reasonable, particularly in the context of the New PPA and its "open-book pricing" structure.<sup>23</sup> 10

#### 11 Q. Is this a very common procedure?

A. No, it is very unusual indeed. In making a purchase I am most interested in the price, not the
 cost. When the salesman assures me that the vendor is losing his shirt on the transaction, I
 normally regard this as sales talk and nothing more. As with this transaction, I first look at the
 price, then check the performance, and finally review the purchase terms and conditions. This is
 particularly true in this situation where the "cost" of the project is somewhat hard to pin down.

#### 17 Q. Did Mr. Nickerson discuss the price Alpha Ventus is being paid?

A. Mr. Nickerson did not note that the price for energy for Alpha Ventus is considerably lower than
 the price being asked for Deepwater Wind in this docket.

#### 20 Q. What is the levelized price for Alpha Ventus?

A. Using an 8% discount rate, the levelized price is \$168.54. This compares to a levelized value of
 \$309.04/MWh for Deepwater Wind. The following chart shows the prices for Alpha Ventus and
 Deepwater Wind:

<sup>&</sup>lt;sup>23</sup> Ibid., page 6.

Docket No. 4185

July 20, 2010

1

#### 2 Q. How were the prices for Ventus Wind derived?

A. Germany, like many members of the European Economic Community sets a "Feed-In Tariff" or
 FIT for renewable energy projects. The Renewable Energy Sources Act (Erneuerbare-Energien Gesetz / EEG) regulates the feed-in power tariff in Germany. This law was adopted in 2000 and
 amended in 2004 and 2008.<sup>24</sup> The initial tariff for offshore wind energy is €13 per MWh for a
 period of 12 years (+ €2 per MWh for all turbines installed before year end 2015). The tariff
 period is extended before reduction to a base level for deeper waters and greater distances
 from the land.

#### 10 Q. Is the German Renewable Energy Sources Act unusual?

A. Not at all. Europe has adopted FITs in many different countries. Programs differ from nation to
 nation, however. A useful monograph has recently been released on the off-shore prices in the
 EEC named "Support schemes for renewable electricity in the EU."<sup>25</sup>

#### 14 Q. Are European Feed In Tariff's lower than the proposed price for Deepwater Wind?

A. Yes. Figure 7 summarizes Feed In Tariffs by technology across the EU. I have reproduced their
 table here, using U.S. dollars per MWh for the convenience of the Commission:

<sup>&</sup>lt;sup>24</sup> About Offshore Wind Energy in Germany, Frank B. Hawn, September 2008.

<sup>&</sup>lt;sup>25</sup> Support schemes for renewable electricity in the EU, European Commission, Joan Canton and Åsa Johannesson Lindén, March 26, 2010.

Docket No. 4185

July 20, 2010

#### 2 Q. Is this the only source on European FITs?

1

A. No. There is an extensive literature on the subject. This monograph is significant because it is
 from an impartial source and was recently published. A second interesting monograph was
 published in 2007 by KPMG.<sup>26</sup>

<sup>&</sup>lt;sup>26</sup> Offshore Wind Farms in Europe, KPMG, 2007. Their comparable table of FITs can be found on page 7:

# 1Q.What proportion of the projects identified in Table 10.1 of the NYSERDA is from counties in2the European Union?

A. The table has 25 entries. One project is from China. This means that 92% of the projects cited
 would be subject to tariffs set in the EU. The United Kingdom accounts for 14 of the projects.
 Great Britain has a complex system of its own, but has recently begun to adopt the Feed-In Tariff
 approach as well.

#### 7 Q. How precisely has Deepwater Wind researched comparable projects?

A. They have apparently depended on the survey by NYSERDA cited above. While the survey is good, it is not as comprehensive as it could be. Within the time limits of Docket 4185, I have conducted a survey of 158 off-shore wind projects either now in service or currently under development. This survey is reproduced as Exhibit RM-2 to this testimony. Within this dataset, five projects meet the criteria of either having been recently placed in service or now being developed as well as having nameplate ratings between 20 and 60 megawatts.

#### 14 Q. Why did you choose the range of 20 megawatts to 60 megawatts?

A. I followed Mr. Nickerson's selection of 60 megawatts in order to include his comparable wind
 farm, Alpha Ventus. The lower limit was chosen to be slightly lower than Deepwater Wind's
 projected capacity.

Overview of Feed-in tariff systems in Europe											
Country	Current tariff ct/kWh	Duration	Subsidies	Grid con- nection	Tax relief						
Denmark	6.95 (Horns Rev II)	50,000 full load hours	-	✓	-						
Germany	9.1	12 years/20 years	-	✓	-						
France	Initially 13.0 then 3.0 – 13.0	Both phases 10 years each	-	-	✓						
Great Britain	13.49	Certificates up to 2027	✓	-	✓						
The Netherlands	MEP tariff stopped	Not covered at present	Not covered at present	Not covered at present	Not covered at present						
Sweden	6.19	Certificates 15 years/ bonus up to 2009	✓	-	-						
Spain	12.03 (max. 16.4)	20 years	-	-	-						

#### 1 Q. Which comparable plants have you identified in your survey?

A. I have identified five offshore wind farms. The projects are in Belgium, Denmark, Germany, and
 the United Kingdom:

Plant	Capacity (MW)	Number of Turbines	Distance from Shore (km)	Depth (m) min	Depth max	In Service Date	Country	Feed-in Tariff Minimu m \$/MWh	Feed-in Tariff Maximu m \$/MWh	Addition To Market?
Alpha Ventus	60	12	56	28	30	2010	Germany	\$ 45.50	\$ 195.00	No
Baltic 1	48	21	16	16	19	2010	Germany	\$ 45.50	\$ 195.00	No
Geofree	25	5	19	20	21	2012	Germany	\$ 45.50	\$ 195.00	No
Sprogo	21	7	10.6	6	16	2009	Denmark	\$ 91.00	\$ 109.20	Yes
Thornton Bank I	30	6	27	13	19	2009	Belgium	\$ 70.00	\$ 123.50	Yes

#### 5 Q. How do we know what prices are paid for these projects?

4

A. Our best estimates depend on finding projects with national tariffs in place. Germany, as
 described above, has a very straightforward tariff. Belgium and Demark also have FITs, although
 their tariffs are of a slightly different format where the FIT is in addition to spot prices.

#### 9 Q. In Denmark and Belgium the FIT is in addition to market prices. What levels are these likely to 10 be?

- 11A.Forecasting energy prices is challenging. Forecasting energy prices in several foreign countries is12especially challenging. I have looked for current forecasts using models I have some familiarity13with. Aurora forecasts indicate a range for base prices are in the range \$65/MWh today through14\$120/MWh in 2030.2715still considerably less than the prices requested by Deepwater Wind.
- 16 Q. Have you found any estimates of actual production costs?
- A. Yes. In a few rare cases we have estimates of their production costs. North Hoyle and Scroby
   Sands, for example, were analyzed as part of a study conducted in 2009.<sup>28</sup> These plants are of
   comparable size to our sample, but went into service some years ago. The following chart
   reproduces the conclusions of that study in 2010 dollars:

<sup>&</sup>lt;sup>27</sup> See, for example, Modelling European Electricity Markets, Stephan Sharma, October 19, 2009.

<sup>&</sup>lt;sup>28</sup> Wind Energy – The Facts, AWEA et al, February 2009, page 219.

Docket No. 4185

July 20, 2010

#### 1

## 2 **Due Diligence**

#### 3 Q. What is "due diligence"?

A. This term describes the common sense review of the facts required before entering into a major
transaction. A reasonable home owner has a home inspection conducted prior to completing
the purchase. This is an everyday form of due diligence. The standards of due diligence
increase as the price tag increases.

#### 8 Q. What level of due diligence has been undertaken by National Grid?

9 A. A year ago it would have appeared that National Grid was proceeding in a normal fashion. The 10 RFP issued included a number of "Bidder Response Forms" that would provide a description of 11 the project under tender, its design, cost, maintenance, and financing. These submitted 12 documents are now overtaken by events since the project has changed size, design, and 13 ownership. As previously noted, National Grid states that it has done little in reviewing the 14 costs of the project.

#### 15 Q. How well is the project described in the proposed contract?

1	Α.	Without any exaggeration, Exhibit A, the description of the facility, is sketchy:
2		EXHIBIT A
3		DESCRIPTION OF FACILITY
4 5 6 7		Facility: The Facility will be a wind generating facility to be located in the waters off the coast of Block Island, Rhode Island. The Facility will have no more than eight wind turbines, and the nameplate capacity of the Facility will be no more than thirty (30) MW.
8 9		This Exhibit A will be supplemented with the Operational Limitations prior to Commercial Operation.
10	Q.	Is this sufficient?
11	A.	No. I would expect the equipment and its nameplate rating to be identified.
12	Q.	What level of due diligence would you consider to be sufficient?
13 14 15 16 17 18	Α.	One would expect a utility to know the exact technology, equipment, and operational characteristics. Ownership and creditworthiness are also minimum standards. An excellent example of due diligence is the final report prepared for the Great Lakes Energy Development Task Force. <sup>29</sup> Contrary to assertions that financial structure should not be considered, the Final Feasibility Report has an extensive set of calculations showing the impact of leverage on economic feasibility. <sup>30</sup>
19	Q.	Can you describe this document?
20 21 22 23	A.	Yes. This pre-procurement document of 424 pages details the technology, industry, cost, contracting, financing, and market for off-shore wind on the Great Lakes. For example, Section 11 – fully 52 pages on project economics – contains vastly more information on the proposed Lake Erie project than anything from National Grid or Deepwater Wind in Docket 4185.
24	Q.	How comfortable are we with the various numbers provided by Deepwater Wind?
25 26	A.	It is difficult to be very comfortable with the materials they have provided so far. Two examples from the most recent pro forma make the shifting nature of their calculations apparent:

<sup>&</sup>lt;sup>29</sup> Great Lakes Wind Energy Center Feasibility Study Final Feasibility Report, Barbi Driedger-Marshall et al, April 2009 at <u>http://development.cuyahogacounty.us/pdf\_development/en-</u> LIS/GLWEC\_Final%20Feasibility%20Report\_4-28-09 pdf

US/GLWEC\_Final%20Feasibility%20Report\_4-28-09.pdf <sup>30</sup> See, for example, Sections 11.2.7.3, 11.2.7.4, and 11.2.7.7.

Docket No. 4185 July 20, 2010

Docket 4111 contained testimony concerning the relatively high O&M values. Deepwater wind responded that these were solid estimates from a respected source.<sup>31</sup> Notwithstanding this response made only several months ago, the O&M numbers have increased significantly in the current pro forma:

5

6 Deepwater Wind's testimony did not address these changes. This undocumented increase in 7 O&M would add .5% to the unleveraged return and over 1% to the leveraged return if 8 eliminated from the calculations.

9 Similarly, the timing of depreciation has changed since Docket 4111:

<sup>&</sup>lt;sup>31</sup> Rebuttal testimony of William H. Moore, Docket 4111, page 11.

#### Docket No. 4185

July 20, 2010

1

#### 2 Q. Are these changes legitimate?

A. It is impossible to know since the originals were undocumented and the new values areundocumented.

#### 5 Q. What is the cost of Deepwater Wind?

- A. This is an intriguing question. The cost in Docket 4111 was \$219,311,412. The cost in Docket
  4185 is \$205,403,512. Deepwater Wind's response to a request to justify the difference was:
- 8 The following differences reconcile the difference between the Docket 41119 Estimate and the Base Amount.
- 10 (1) The contingency in the Docket 4111 Estimate has been reduced. This 11 reduction results from a combination of factors. First, since the date of the 12 development of the Docket 4111 Estimate last fall, Deepwater Wind has been 13 engaged with various vendors and has done additional engineering of the 14 facility. As a result, Deepwater Wind has removed various areas of uncertainty, 15 and therefore Deepwater Wind's confidence in its estimates is greater than it 16 was in the fall of 2009.
- (2) When Docket 4111 was pending, Deepwater Wind was still being considered
  for a Department of Energy Federal Loan Guarantee. Since the decision in
  Docket 4111, Deepwater Wind has been notified by the Department of Energy,
  that Deepwater Wind's application was not accepted. Accordingly, the financing

1costs of the facility that are in the Base Amount are higher than the financing2costs in the Docket 4111 Estimate.32

Answer (1) indicated that the hitherto contingency amounts in the construction estimate have been reduced. Answer (2) indicates that the costs in Docket 4185 are larger than in Docket 4111 due to higher financing costs. The answer also contains a difficult to follow argument that the project cost is, in some fashion, dependent on the target unlevered return:

- 7 The Base Amount, which is the measure against which realized savings are 8 shared with the ratepayer, is approximately \$14,000,000 less than the Docket 9 4111 Estimate. The Base Amount represents Deepwater Wind's estimate of a 10 facility cost that Deepwater Wind projects will yield an acceptable unlevered 11 return (approximately 10.5%) and a risk/return profile that will likely attract the 12 financing necessary to construct the project.<sup>33</sup>
- 13 Q. Does this reassure you that we know the cost of this project?
- A. No. Like Mr. Hahn, I am troubled that the cost of the project identified in the cost adjustment
   provision is now different than the cost used to develop the price of the project. It appears that
   the difference approximately 10% of the total cost of the project has been reserved to
   increase profits from the project and may not represent costs at all.

# 18Q.Is it necessary that the cost estimates be confused with the required rate of return for the19project?

A. No. Deepwater Wind should provide a solid cost of the project and then justify a rate of return
 that would make it viable. These are separate issues and should be addressed as different parts
 of the analysis.

# Q. Please characterize how commercially reasonable the current level of due diligence is on this project.

A. As previously stated, the due diligence has not been seriously undertaken by the buyer.
 Moreover, different estimates of the cost of the project have been changing without
 explanation or documentation. If I was advising the buyer in this transaction I would advise
 against going ahead without further verifiable information.

<sup>&</sup>lt;sup>32</sup> Deepwater Wind Block Island, LLC Response to the Division of Public Utilities and Carriers' Data Request Div 1-4, page 2.

<sup>&</sup>lt;sup>33</sup> Ibid., page 1.

### 1 **Contract Language**

#### 2 Q. What is "contract failure"?

A. Contracts are an imperfect statement of the objectives of the counterparties at the time of
 signing. Any reasonably experienced businessperson is well-acquainted with just how imperfect
 even the best of intentions may be as a guide to the future. Contracts fail because the terms
 and conditions are not sufficient to deal with changing circumstances, changes in law or
 regulations, buyer's and seller's remorse, bankruptcy, and even issues of market manipulation.

In my review of the contract under discussion here, the standard of review – Section 19.5 – cited
 Morgan Stanley Capital Group Inc. v. Public Utility District Number 1 of Snohomish, Washington.
 This is a case that I have worked on for the past eight years, and is possibly the most famous
 example of contract failure in the history of the electricity industry.

- 12 In this case the contract failed due to revelations concerning the widespread market 13 manipulation during the period when the contract was signed and the possible involvement of 14 the seller, Morgan Stanley.
- 15 The Morgan Stanley transaction was approximately the same size as that under discussion here. 16 The case has passed through FERC (Federal Energy Regulatory Commission) the Ninth Circuit 17 Court of Appeals, and the U.S. Supreme Court, and presently awaits rehearing at FERC.

# 18Q.Is there any reason to fear problems with this in the contract between National Grid and19Deepwater Wind?

A. One always considers future problems. As I have noted, the technology is new to the seller, the
 prices are high compared to market, and little, if any, due diligence has been exercised by the
 buyer. In addition, this transaction could easily have problems with bankruptcy, delay, or
 regulatory changes.

#### 24 Q. How would you characterize the billing language contained in Exhibit E?

- A. The language is difficult to follow and likely to cause disputes in later years.
- 26 Q. Please give an example.
- 27 A. Section 3 states:
- 28Adjustment to Bundled Price for Forward Capacity Market Payments. Beginning29in the fourth Contract Year, each monthly payment due to Seller under this30Exhibit E will be reduced by the amount that Seller is or would have been

1 eligible to receive in the ISO-NE Forward Capacity Market or any replacement 2 market for capacity in ISO-NE, without regard to whether the Facility has 3 actually qualified as a Capacity Resource in the Forward Capacity Market or 4 whether the Facility has received a Capacity Supply Obligation for the Capacity 5 Commitment Period during which the applicable billing period occurred. If the 6 Facility has not qualified as a Capacity Resource or received a Capacity Supply 7 Obligation for the relevant Capacity Commitment Period, Buyer shall calculate 8 the reduction due under this Section 3 assuming that the Facility had qualified 9 as a Capacity Resource and received a Capacity Supply Obligation, based on 10 information obtained from Seller and publicly available information from ISO-NE, which calculation shall be binding, absent manifest error. Seller shall use 11 12 commercially reasonable efforts to cooperate with Buyer in calculating this 13 reduction.

14 Q. How would you interpret this section?

A. The buyer deducted the deemed capacity revenues from his payments to the seller. The New
 England ISO capacity markets have been highly controversial and it would appear that the risks
 of the capacity market have been left with the seller.

#### 18 Q. Might there be different interpretation of this section?

- A. Easily. There are detailed calculations involved in the determination of "Capacity" as noted
   above. Even if the two parties agree on the calculation of "Capacity", it is common for
   administered capacity markets to have different bidding options. Presumably, National Grid
   could deem a more successful bidding strategy for Deepwater Wind than it actually employed.
- 23 Q. How would you interpret the last sentence?
- A. I cannot. It is effectively meaningless. I would have advised a fallback provision to other data at
   the New England ISO or a different solution to this problem entirely. Asking counterparties to
   calculate hypothetical "what if" cases is likely to be contentious. A similar provision in the
   power contracts of the Bonneville Power Administration has been litigated for almost thirty
   years.<sup>34</sup>
- 29 Q. Can you point out any serious problems with this contract?

<sup>&</sup>lt;sup>34</sup> Section 7(b)(2) of the 1980 Pacific Northwest Electric Power Planning and Conservation Act specifies a similar counterfactual calculation and has been the subject ever since.

A. Yes. I have identified two important problems. One is so unusual that I am tempted to describe
 it as a contract drafting error. The other constitutes an unusual feature that may eliminate
 seller's credit support after the onset of commercial operation.

#### 4 Q. What is "credit support"?

5 A. Credit support is a common feature in energy contracts where the parties take precautions to 6 ensure that the counterparty will be financially able to perform under the contract. In this case 7 the provision is quite moderate: \$10/kW of nameplate capacity during the period before 8 commercial operation. As noted above, the contract is somewhat unclear about the nameplate 9 capacity, since Exhibit A only specifies that the contract is less than 30 megawatts.

10 **Q.** How much money is involved?

11A.There are 1,000 kilowatts in a megawatt, so the seller's per-commercial operation credit support12is \$10 x 1,000 x 30 megawatts at most, or \$300,000. This is small compared to the estimated13\$205,403,512 million in projected program costs from Appendix X – approximately one day of14the projected construction costs.

- 15 Q. Is this sufficient to protect National Grid and ratepayers against possible contingencies?
- A, No. However, all contract negotiations are complex and the small degree of credit support may
   have been conceded by National Grid in return for some concession by Deepwater Wind.

18 Unfortunately, it appears that there either was a drafting error or a miscomprehension on 19 behalf of National Grid in the next section that might well reduce seller's credit support to zero 20 after commercial operation.

- 21 Q. What is the problem?
- A. A close reading of the credit support language after commercial operation reveals a possibledrafting error:

(b) On or before the tenth (10th) day following the date on which Commercial 24 25 Operation occurs, Seller shall provide Buyer with Credit Support to secure Seller's obligations under this Agreement ("Operating Period Security"). The 26 27 Operating Period Security shall be \$30 per installed kW of Capacity and shall be subject to replenishment from time to time, within five (5) Business Days after 28 29 Buyer draws on the Operating Period Security, up to the amount required by 30 this Section 6.1(b), but in any event, not to exceed \$1,800,000 on an aggregate, 31 cumulative basis, including all prior Credit Support provided as Operating Period 32 Security. Buyer shall return any undrawn amount of the Operating Period

5 At first reading it appears that seller's credit support is intended to increase from \$10/kW to 6 \$30/kW after commercial operation. The use of the term "Capacity" poses a problem, however, 7 since "Capacity" is a defined term in this contract:

- 8 "Capacity" shall mean on or as of any date of determination, the Facility's 9 capability to generate a specific amount of electrical energy at any point in time, 10 including without limitation, all capacity from the Facility as determined by ISO-NE's Seasonal Claimed Capability rating (or successor or replacement rating 11 12 used to measure capability) as defined in the ISO-NE Rules that is obligated to 13 deliver and receive payments in the Forward Capacity Market (or its successor 14 market) as set forth in the ISO-NE Rules, including without limitation as both a "New" and an "Existing" Capacity Resource as those terms are used in the ISO-15 NE Rules.35 16
- 17 This sets the amount of credit support upon a determination by the New England Independent 18 System Operator, which sets capacity for wind based on its Market Rule 1 which describes an 19 extensive qualification process that is likely to change over time.

#### 20 Q. What is the capacity associated with a wind resource?

A. There is extensive debate on this point throughout the U.S. and Canada. Traditionalists argue that wind resources often have zero capacity value since the wind might not be blowing at system peak. New England currently has a less rigorous standard that provides some capacity value depending on site-specific data.<sup>36</sup> It is not necessary for this debate to be recapitulated in this proceeding. It is important, however, to realize that the credit support will change by season and may well be zero if the New England ISO standards change or Deepwater Wind fails to meet the certification standards set out in the ISO New England tariffs.

#### 28 Q. Can you describe the ISO-NE's Seasonal Claimed Capabilities protocol?

A. Yes. The Seasonal Claimed Capabilities for wind assets are determined by the process described
 in the Intermittent Power Resources section of the NE ISO's Market Rule 1 III.13.1.2.2.2,
 subsections 1 and 2.

<sup>&</sup>lt;sup>35</sup> Amended PPA, page 2.

<sup>&</sup>lt;sup>36</sup> See III.13.1.1.2.2.6. Additional Requirements for New Generating Capacity Resources that are Intermittent Power Resources and Intermittent Settlement Only Resources.

Docket No. 4185 July 20, 2010

1 For Intermittent Power Resources, or Intermittent Settlement Only Resources, 2 the first Forward Capacity Auction Qualified Capacity is determined by the 3 median of the net output during the Summer or Winter Intermittent Reliability 4 Hours. For all other Forward Capacity Auctions, the median of the first five years 5 sets the quantity. Summer is defined as lasting from June through September, 6 and winter is defined as October through May. Summer Intermittent Reliability 7 hours are 2 pm through 6pm, while winter hours are 6pm through 7 pm. For 8 Resources that have not yet achieved Commercial Operation the Qualified 9 Capacity is equal to the capacity cleared from the resource as a New Generating 10 Capacity Resource in previous Forward Capacity Auctions.

(a) With regard to the first Forward Capacity Auction, for each of the previous 11 12 four summer periods, the ISO shall determine the median of the Intermittent 13 Power Resource's and Intermittent Settlement Only Resource's net output in the Summer Intermittent Reliability Hours, as defined in Section 14 15 III.13.1.2.2.2.1(c). With regard to any Forward Capacity Auction after the initial 16 Forward Capacity Auction, for each of the previous five summer periods, the ISO 17 shall determine the median of the Intermittent Power Resource's and 18 Intermittent Settlement Only Resource's net output in the Summer Intermittent 19 Reliability Hours, as defined in Section III.13.1.2.2.1(c).

21(c) The Summer Intermittent Reliability Hours shall be hours ending 140022through 1800 each day of the summer period (June through September) and,23after June 1, 2010, hours ending 1400 through 1800 each day of the summer24period (June through September) and all summer period hours in which the ISO25has declared a system-wide Shortage Event and if the Intermittent Power26Resource or Intermittent Settlement Only Resource was in an import27constrained Capacity Zone, all Shortage Events in that Capacity Zone.37

#### 28 Q. Did Mr. Nickerson conduct a calculation of Seasonal Claimed Capacity?

29 A. Yes. His calculations are:

20

30While the expected overall annual capacity factor is 40% on an energy basis, for31FCM purposes the project has a 36.1% capacity factor in the summer (June32through September under ISO-NE rules) and a 50.0% winter value. On a33seasonally weighted basis the capacity factor is 45.3% and multiplied by 28.834MW, the project's FCM value is about 13 MW.<sup>38</sup>

<sup>&</sup>lt;sup>37</sup> Market Rule 1 III.13.1.2.2.2.1 Summer Qualified Capacity for an Intermittent Power Resource and Intermittent Settlement Only Resource.

<sup>&</sup>lt;sup>38</sup> Docket No. 4111, Direct Testimony of David Nickerson, page 23.

1 2	Q.	Can you describe the results of defining credit support in terms of the ISO-NE's Seasonal Claimed Capability protocol?
3 4 5 6	A.	Yes. Using Mr. Nickerson's estimates, credit support would be equal to the nameplate capacity in kilowatts multiplied by the seasonal capacity factor, multiplied by \$30. Winter credit support would be 28.8 MW x 1,000 x 50.0% x \$30 = \$432,000, and summer credit support would be 28.8 MW x 1,000 x 36.1% x \$30 = \$311,904.
7	Q.	Is this a commercially reasonable provision for credit support?
8 9	A.	No. It is not reasonable to calculate credit support based on a standard designed to qualify the project at a later date for inclusion in the ISO-NE capacity markets.
10	Q.	Is this the only error in the contract?
11 12	A.	No. A considerably more serious error occurs in Section 9.3. This section summarizes remedies – specifically termination payments if the contract fails. Section 9.3(b)(ii) states:
13 14 15 16 17		(ii) Termination by Seller On or After Construction Financing. If Seller terminates this Agreement because of an Event of Default by Buyer occurring on or after the close of construction Financing for the Facility, the Termination Payment due to Seller shall be equal to the amount, if positive, calculated according to the following formula:
18		$\Sigma[(CV - MV) + P]$
19		N
20		where:
21 22		"Σ" is the summation over the Services Term. N
23 24 25		"CV" is the contract value of the Products for the remainder of the Services Term calculated with reference to the applicable Price and the Supply Forecast.
26 27 28		"MV" is the market value of the Products for the remaining Services Term as determined with reference to the applicable Resale Price and the Supply Forecast.
29 30 31		"P" is the amount of any applicable penalties and administrative costs incurred by Seller in selling the Products not accepted and paid for by Buyer as a result of the termination of this Agreement.

Docket No. 4185 July 20, 2010

#### 6 Q. Can you describe the problem?

A. Yes. Both this section and Section 9.3(b)(v) omit calculating the present value of the future stream of payments. Since this is a twenty-year contract, the termination payment as calculated here will differ from the actual economic interests of the parties by a considerable degree.
Citing the present value in termination provisions is the standard since the termination payment is intended to make the injured party whole, not confer a windfall profit or loss.

#### 12 Q. Why does this matter?

A. If one of the parties has an incentive to make the contract fail, it will add to the probability that
the contract will fail. This omission creates such an incentive.

#### 15 Q. Why do you think that this is an omission?

- A. The contemporaneous contract between Cape Wind and National Grid includes the language
   specifying present value in the termination payment calculation:
- 18 "RV" is the replacement value of Buyer's Percentage Entitlement of the
  19 Products for the remainder of the Services Term, calculated with reference to
  20 the applicable Replacement Price and the Supply Forecast, using a discount
  21 factor of eight percent (8.0%).
- "CV" is the contract value of Buyer's Percentage Entitlement of the Products for
  the remainder of the Services Term calculated with reference to the applicable
  Price and the Supply Forecast, using a discount factor of eight percent (8.0%)
  (the "Contract Value").
- 26 "P" is the amount of any applicable penalties and costs incurred by Buyer in
  27 replacing the Products not Delivered to Buyer as a result of the termination of
  28 this Agreement.<sup>40</sup>

<sup>&</sup>lt;sup>39</sup> Amended PPA, page 31.

<sup>&</sup>lt;sup>40</sup> POWER PURCHASE AGREEMENT BETWEEN MASSACHUSETTS ELECTRIC COMPANY AND NANTUCKET ELECTRIC COMPANY, D/B/A NATIONAL GRID, AS BUYER AND CAPE WIND ASSOCIATES, LLC, AS SELLER As of May 7, 2010, page 44.

#### 1 Q. Are there other problematic issues in the contract?

2 Yes. As I mentioned above, the size of the project is not specified in the contract. Exhibit A sets Α. 3 the maximum nameplate capacity at 30 megawatts and limits the project to eight turbines. 4 Appendix X reduces the bundled price as the project's cost falls below \$205,403,512 without specifying the amount of equipment being purchased. Exhibit Y specifies - with a small 5 6 mathematical error – the production target as a function of the as yet undetermined nameplate 7 capacity. This gives Deepwater Wind an interesting incentive to increase the capacity of the 8 project to 30 megawatts even if the purchaser might have gained a price reduction under 9 Appendix Y at 28.8 megawatts.

#### 10 Q. Is this a fruitful area for future litigation?

A. Conceivably. Nameplate capacity is just that – the capacity on the nameplate. It is not a defined
 term in the contract, nor is nameplate capacity always identical with actual capacity. Moreover,
 although Deepwater Wind's calculations have envisaged eight turbines at 3.6 megawatts, other
 configurations are certainly possible. Alpha Ventus, for example, is using the recently
 introduced 5 megawatt turbines.

#### 16 Q. Can you describe the small error in Exhibit Y?

A. Yes. Exhibit Y omits to calculate the correct number of hours in leap years. Section 1.(a) sets
 the number of hours to 8,760 for every contract year regardless of the actual number. This is
 not a major issue, but it does go to the question of the level of review exercised in the
 preparation of the contract.

#### 21 Q. Can you easily interpret the language in Exhibit Y?

A. No. While the language may not be in error, it lacks clarity. I presume that it is intended to
 match the interpretation but forward by Mr. Nickerson in Docket 4111:

The second reduction is called the Outperformance Adjustment Credit which is 24 25 effectively a 50% discount to the Bundled Price that applies to energy the 26 project generated above an assumed 40% capacity factor, on a cumulative basis. 27 Using an installed capacity of 28.8 MW, the project in a typical year would 28 generate 100,925 MWh at a 40% capacity factor (28.8 MW x 8,760 hrs x .40). 29 This becomes an annual target output and to the extent over the term of the contract the actual cumulative generation exceeds the amount of the 30 31 cumulative target, a production surplus is calculated. Half of this surplus then

9	Q.	Does this complete your testimony?
8		needing a thorough review before execution.
7		important sections are unclear and may lead to controversy, and it gives an overall sense of
6	A.	It is not a commercially reasonable document. As noted above there are possible errors,
5	Q.	How "commercially reasonable" is this contract?
4	Α.	Yes, or alternatively, directly include Mr. Nickerson's interpretation in the example.
3	Q.	Would you change this?
1 2		becomes a credit at the then current Bundled Price in \$/MWh, as adjusted for the FCM payments. <sup>41</sup>

10 A. Yes.
