

Division 8-1

Request:

For each of the proposed performance incentive mechanisms without an associated commission-approved program, please state whether the Company plans to file an implementation plan for commission approval of actions the Company will take to achieve the targets.

Response:

The Company intends to include the majority of the actions or programs necessary to support the achievement of performance incentive mechanisms for which the Company seeks to recover costs in the Company's Power Sector Transformation (PST) annual plan. The Company will present the annual plan to the Public Utilities Commission (PUC) for review and approval beginning with the first annual plan to be filed on December 1, 2018.

For projects and programs currently planned for and recovered through the Company's Infrastructure, Safety, and Reliability (ISR) Plan, for which the Company has proposed a performance incentive mechanism, the Company will continue to present those projects and programs to the PUC for review and approval as part of the annual ISR Plan; however, the Company proposes to recover any performance incentive mechanisms associated with those projects and programs through the PST factor.

(This response is identical to the Company's response to Division 25-1 in Docket No. 4770.)

Division 8-2

Request:

Please refer to Schedule PST – 1, Chapter 9 – Performance, Page 6 of 22, in which the earnings level is described as “a payment calculated based on equivalent basis point value determined by the size of the rate base in the given year.”

- a. Does “given year” refer to the rate year, or the year of performance?
- b. If “given year” refers to the rate year, how does the Company expect performance incentives to be determined in the next rate case?
- c. If “given year” refers to the year of performance, please explain whether and how this creates an incentive for the Company to increase its rate base.

Response:

- a. “Given year” refers to the rate year ending August 31, 2019, and each of the two following years ending August 31, 2020 and August 31, 2021.
- b. The Company has proposed performance incentives that would apply to calendar years 2019, 2020, and 2021. The Company would expect the performance incentives for these years to be valued based on the electric distribution rate base for rate years 2019, 2020, and 2021, respectively.
- c. Please refer to the Company's response to part a. above.

(This response is identical to the Company's response to Division 25-2 in Docket No. 4770.)

Division 8-3

Request:

Please describe whether the Company intends to develop performance incentive mechanisms for the following categories in future proceedings and, if the Company does not intend to do so, please explain why:

- a. Customer information and data (e.g. increased access to customer information)
- b. Income eligible customers
- c. Distribution system planning
- d. Development of a data portal
- e. Non-wires alternatives

Response:

- a. As noted in Schedule PST-1, Chapter 9 – Performance on Bates Page 175 of PST Book 1, there is value in an incentive related to access to customer information, but it would be best developed as AMF deployment advances. To that end, the Company expects to consider proposing such an incentive in future proceedings.
- b. As noted in Schedule PST-1, Chapter 9 – Performance on Bates Page 175 of PST Book 1, development of a performance incentive related to income eligible customers should follow implementation of the Company's proposals affecting income eligible customers. To that end, the Company expects to consider proposing such an incentive in future proceedings.
- c. The Company has already developed an incentive mechanism through its approved 2018 System Reliability Procurement (SRP) report around distribution system planning to measure the Company's performance in delivering the Rhode Island System Data Portal. Once stakeholder input is gathered as to the portal's efficacy with the distributed energy resources (DER) community/developers, the Company expects to consider proposing modifications of such an incentive in future proceedings.
- d. Please see the response to part c. above.
- e. One of the Company's approved incentives in the 2018 SRP would allow the Company to share 20 percent of the net benefits (using the Utility Cost test) of DERs installed due to SRP initiatives. The Company is interested in proposing additional incentives for non-

wires alternatives in the future and expects to continuously evaluate opportunities to propose such mechanisms in future proceedings.

(This response is identical to the Company's response to Division 25-3 in Docket No. 4770.)

Division 8-4

Request:

For each performance incentive mechanism, please describe how the determination of the target achievement (and subsequent reward) will be calculated and confirmed?

Response:

As part of its annual Power Sector Transformation reconciliation filing, for each performance incentive mechanism target, the Company will report its performance relative to the target, identify achieved savings and benefits, and display calculations for each incentive earned, including proration of any incentives related to metric achievement between the minimum, midpoint, and the maximum target levels. The Company will also provide explanations for any targets not achieved. The Company describes the specific data that it will report for each performance incentive below.

- Monthly Transmission Peak Demand Reduction: The Company will report and demonstrate the calculations for the annual sum of reductions in the weather normalized monthly peaks on a year-over-year basis. The loads to be weather normalized will be those used in calculating monthly ISO-NE Regional Network Service (RNS) billings. For 2019, for example, the Company will report the difference between the sum of weather normalized monthly peak demands for 2018, and the sum of weather normalized monthly peak demands for 2019.
- Forward Capacity Market Peak Demand Reduction: The Company will report and demonstrate the calculations for the reductions in the weather-normalized annual peak load on a year-over-year basis, using the same data as discussed above. For 2019, for example, the Company will report the difference between the weather normalized annual peak demand for 2018, and the weather normalized annual peak demand for 2019.
- EV Residential Off-Peak Charging Rebate Participation: The Company will report the number of customers enrolled in the Company's proposed rebate program for off-peak EV charging as of the end of the calendar year and evaluate this number against the target for the calendar year.
- DG Friendly Substation Transformer: The Company will report the number of substation transformers that have ground fault detection (3V0) installed as of the end of the calendar year.

- Demand Response - Connected Solutions Participation: The Company will report the number of residential customers participating in the Company's Connected Solutions program.
- Demand Response – Commercial and Industrial (C&I) Participation: The Company will report the number of contracted MWs in the Company's C&I demand response programs.
- Electric Heat: The Company will report the annual CO₂ reductions in metric tons attributable to the ground-source heat pump and equipment incentives being offered under the Electric Heat Initiative. As discussed in the Company's response to Division 8-18, because of the costs and complexities of directly metering customer heating system use, the Company does not propose to directly measure CO₂ reductions of the Electric Heat Initiative, but rather to assign deemed CO₂ savings values to each type of conversion. Total deemed CO₂ savings realized through each year of the program will be a function of how many conversions of each system type are delivered each year.
- Electric Vehicles: The Company will report the incremental increase – above levels predicted by the Company – of personal electric vehicles registered in the Company's service territory on annual basis. Electric vehicles will include both battery electric vehicles (BEVs) and plug-in hybrid electric vehicles (PHEVs). The Company will report the total number of new registrations in Company service territory during the calendar year, using data from the R.L. Polk Vehicles in Operation data source, in comparison with the Company's projections shown in Worksheet 9.3, reproduced here as Attachment DIV 8-4. Please see Row 17, Columns K through M, for the forecast values that will be used to demonstrate whether the Company's targets have been achieved.
- Behind the Meter Storage: The Company will report incremental MW of installed behind-the-meter storage for the preceding calendar year.
- Company-Owned Storage: The Company will report the incremental MW of Company-owned storage installed during the preceding calendar year in support peak reduction or provide system benefits. The Company expects to provide a clear demonstration of peak reduction or system benefits in order to earn the incentive.
- AMF Customer Engagement: For the preceding calendar year, the Company will indicate whether the relevant milestone or target for that year was achieved. Relevant milestones/targets are shown below. For 2021, the Company expects to quantify the number of meter installations to demonstrate achievement of the 30 percent deployment target. Additional discussion of these milestones is provided in Schedule PST-1, Chapter 9 – Performance on Bates Page 175 of PST Book 1.

Year	Milestones	Basis Points
2019	Deliver customer engagement plan	2
2020	Conduct and report on customer awareness survey	1
2020	Commence mass scale meter deployment	1
2021	Achieve 30% deployment and customer portal access	2

- VVO Pilot Delivery: For 2019, the Company will report whether the project is in service. For 2020 and 2021, the Company will report and demonstrate whether the incremental one percent reduction in energy consumption and peak demand in addition to what is expected from primary VVO/CVR optimization has been achieved.
- Interconnection Support - Time to Interconnection Service Agreement (ISA): The Company will report the percent difference between: (1) the aggregate number of business days allowed by the Interconnection Tariff to provide an executable ISA over all processes; and (2) the average time measured in business days necessary for the Company to provide a customer with an executable ISA, commencing from the date a completed application is received, over all processes.
- Interconnection Support - Average Days to System Modification: The Company will report the percent difference between: (1) the total aggregate number of business days allowed by the Interconnection Tariff to complete system modifications, over all processes; and (2) the average time measured in business days necessary for the Company to complete system modifications, commencing from the date of execution of the ISA, over all processes.
- Interconnection Support - Estimate Versus Actual Costs: The Company will report the overall percent difference between the sum of costs estimated by the Company for interconnection and the sum of the actual costs paid by interconnecting customers.

(This response is identical to the Company's response to Division 25-4 in Docket No. 4770.)

Division 8-5

Request:

Please refer to Workpaper 9.1 regarding peak reduction targets.

- a. Please provide the electronic file (e.g., Excel workbook with all formulas intact) for each page of this workpaper.
- b. Please explain what the “storage” category of peak impacts (totaling 1 MW in 2019 at the midpoint) includes. Is this utility-owned storage, customer-owned storage, or something else?
- c. The Company’s behind-the meter storage target is 3 MW in 2019, and the company-owned storage target is also 3 MW in 2019. Would achievement of these targets reduce the peak demand baseline by 6 MW in 2019? Please provide supporting data and calculations in electronic format to show how, if at all, the peak demand baseline would be modified.
- d. Please explain what the “Solar PV” category of peak impacts (totaling 7 MW in 2019 at the midpoint) includes. Is this utility-owned solar PV, customer-owned solar PV, or something else? Is it attributable to a specific program that the Company will be earning an incentive for? Please provide supporting data and calculations in electronic format.
- e. Please explain whether and how the Income Eligible Solar Program peak reduction has been factored into the baseline forecast of peak demand and provide supporting calculations in electronic format. If not, please explain why they are excluded.
- f. If the Company fails to achieve targeted reductions in peak attributable to a specific DER but achieves targeted savings due to incremental effort, does the Company propose to still earn the financial incentive for achieving the target, even though the overall peak load target was not attained? For example, if the Company achieved only 41 MW of DER impacts in 2019 (rather than the 46 MW shown for the midpoint peak reduction target), but achieved 5 MW of incremental savings such that the final peak load was 1682 MW, rather than 1677 MW, does the Company propose that it would earn a reward?
- g. The Company is proposing to earn 12 basis points for attaining target peak demand reductions. After removing MW of peak demand reductions that are covered by other incentives, would the Company’s proposal award 12 basis points for 5 MW attributable to incremental effort in 2019? If not, please explain.

Response:

- a. Please see Attachment DIV 8-5 for an electronic version of Workpaper 9.1. This attachment reflects the changes to Workpaper 9.1 discussed in the response to part e. below.
- b. The minimum peak reduction contribution from storage is consistent with the peak impacts of the Company's proposed storage project that were reflected in the benefit cost analysis for that program. The midpoint and maximum levels assume additional storage penetration in the market, and consequent peak reductions, though these values are not based on any specific market projections or Company programs. In that sense, they are not unlike the "incremental effort" that is factored in to the final peak target.
- c. The Company has not defined a specific baseline in its calculation of peak demand reduction targets, but rather illustrated in step-by-step fashion in Attachment DIV 8-5 how they were developed from the Company's peak demand forecast. It is not clear what stage of the calculation the "baseline" in the question is intended to reference. The Company's achievement of its peak demand reduction targets is evaluated not against a counterfactual baseline but against the previous year's weather-normalized peak load.

The achievement of the Company's behind-the-meter storage and Company-owned storage targets would not change the evaluation of its peak demand reduction targets, nor should it. Both storage performance incentive mechanism targets are denominated in terms of installed storage capacity, not peak demand impacts. The performance incentive mechanisms for storage were intended to support Company efforts to evaluate and promote storage as a resource, in support of the State's clean energy goals and the Power Sector Transformation goal of building a more flexible energy system to integrate more clean energy generation. The Phase One Power Sector Transformation Report supports the inclusion of individual performance incentive mechanisms for storage, "to accelerate deployment of a new flexible resource" (Page 26).

Potential benefits from storage are broader than system peak reduction, and include supporting renewable energy integration, providing ancillary services such as frequency regulation, enhancing reliability, and reducing peak demands at substations or feeders that may not be coincident with the system peak. To that end, the storage performance incentive mechanisms are largely complementary to the peak reduction performance incentive mechanisms. The storage Performance Incentive Metrics support the broader objective of deployment of cost-effective storage and supports State's renewable energy goals, and in combination with a peak demand reduction Performance Incentive Metric will encourage the Company to maximize the potential system benefits from storage deployment.

- d. The Company's estimated impacts of Solar PV on peak demand is based on ISO New England's Forecast Report of Capacity, Energy, Loads, and Transmission. Three mutually exclusive PV resource types are included in ISO New England's (and thus, the Company's) forecast:

- PV as a resource in the Forward Capacity Market (FCM)
- Non-FCM energy-only resources and generators
- Behind-the-meter PV

The Company has not disaggregated the peak demand reductions from solar PV into contributions from specific programs. However, the Company is likely to earn an incentive through either the Renewable Energy Growth Program or the existing incentive on long-term contracts on some of the solar installations that contribute to these estimated peak reductions. Peak reductions from energy efficiency and solar PV that are already captured in the Company's forecast – and thus assumed to be forthcoming under business as usual – were not included in the Company's assessment of potential forward capacity market savings from the annual peak reduction targets. As such, their value was not factored in to size of the incentive to avoid rewarding the Company for reductions that would have happened anyway, and for which, in the case of energy efficiency, the Company expects to receive a peak MW-based incentive.

- e. The peak reductions from the income eligible solar program were not included in the Company's calculation of peak targets. Attachment DIV 8-5 updates the peak target calculations to add the impact of this program to the projected peak impacts from solar PV. The Company also updated the peak target calculations to reflect the impact of the proposed electric vehicles program. Inclusion of these two small peak impacts does not affect the calculated targets or the level of incremental effort required to achieve those targets.
- f. No. The incentive would only be awarded if the overall peak demand reduction target is achieved. Although expected resource contributions were used to set peak demand reduction targets, achievement of the targets is intended to be evaluated strictly based on whether the weather-normalized peak reduction for a given calendar year meets the specified target reduction from the weather-normalized peak in the prior calendar year. For example, to earn the minimum incentive for 2019, weather-normalized peak demand in that year must be 22 MW below the weather-normalized peak demand in 2018. An overall peak reduction target, rather than a set of resource-specific sub-targets, will encourage the Company to seek out the most cost-effective peak reductions regardless of the underlying resource.
- g. The Company would be awarded 12 basis points in 2019 if it achieves the 29 MW peak demand reduction target for 2019. The Company currently receives an incentive for MW

reductions from energy efficiency. Forecast peak reductions due to energy efficiency (and solar PV) were excluded from the calculation of benefits from FCM savings that were used to assign a basis point value for the achievement of the peak reduction target. As the Company discussed in Schedule PST-1, Chapter – 9 – Performance (Bates Pages 179-180 of PST Book 1), customers will retain the majority of benefits created under this incentive. In addition, the Company expects that it will be required to demonstrate that MW savings from energy efficiency programs that are rewarded under the existing efficiency incentive structures are not being awarded an additional incentive through the FCM peak reduction performance incentive mechanism.

(This response is identical to the Company's response to Division 25-5 in Docket No. 4770.)

Summary of Forward Capacity Market and Monthly Transmission Peak Reduction Targets

Division 8-6

Request:

Refer to Schedule PST – 1, Chapter 9 – Performance, Page 18 of 22 regarding estimation of the benefits of FCM savings in the year 2022 due to the achievement of the 2019-2021 targets.

- a. Does the Company have an expectation for how long such savings are expected to persist? If yes, please describe the assumptions underlying the Company's expectations (e.g., the resources to be deployed to achieve the savings and the resources lives.)
- b. Please provide the annual and cumulative savings for the expected duration of the savings. Please provide these values and associated calculations in an Excel workbook with all calculations and formulas intact.

Response:

- a. The Company did not make a specific assumption about the longevity of peak demand savings in its proposal. In estimating the year 2022 forward capacity market (FCM) savings, the Company noted that it expects the MW saved in achieving the 2019-2021 targets will be maintained for the duration of project lives. The 2022 savings estimate required only the assumption that savings be available for at most four years (2019 MW reductions would remain available in 2022).¹ This was a highly conservative estimate of the potential benefits of this performance incentive, because realistically, most savings can be expected to endure for a longer time period.

As the Company noted in its proposal, peak demand reductions may come from a number of resources, including additional efficiency, distributed generation, storage, VVO/CVR, and demand response. The expected lives of individual resources will vary. For example, in its benefit cost analysis submitted as Attachment DIV 1-1-3, the Company assumes a useful life of 25 years for solar PV, and 12 years for storage. The Company's benefit cost analysis of VVO with AMI (see Attachment DIV 3-20) assumes a useful life of 25 years for VVO. For peak reductions from demand response, the longevity of those savings will depend upon the nature of the program. Programs that use load control technologies can be expected to retain peak reduction benefits over the lifetime of the technology. The longevity of savings in programs requiring customer response to called

¹ Even for called demand response events, it is reasonable to assume that savings persist over this period. The Company expects to be able to grow demand response enrolled and participating capacity as programs ramp up over the next few years, such that it can be expected that the same reductions are achieved (and expanded) from year to year.

events will depend on customers' continued enrollment and willingness and ability to provide the necessary level of load relief.

- b. As noted above, the Company has not made specific assumptions about the resource mix that will contribute to peak demand and the resulting longevity of peak demand reductions. However, Attachment DIV 8-6 provides illustrative calculations demonstrating the potential FCM savings through 2035 from achievement of the peak reduction targets over the years 2019 through 2021, assuming a 15-year lifespan for peak demand reductions. The analysis suggests net present value (NPV) of FCM savings ranging from \$33 million when the minimum targets are achieved, to \$87 million when maximum targets are achieved. In practice, the actual longevity of peak demand reductions may be longer or shorter, depending on the resource. In addition, the Company notes that additional expenses may be necessary to sustain the reductions over time, particularly in the case of demand response. As indicated in Schedule PST-1, Chapter 9 – Performance in Table 9-18 (Bates Page 180 of PST Book 1) indicates, the NPV of the incentive that would be paid to the Company for achieving targets over the years 2019-2021 ranges from about \$887,000 at the minimum level, to about \$2.7 million at the maximum level.

(This response is identical to the Company's response to Division 25-6 in Docket No. 4770.)

Division 8-7

Request:

Refer to response to DIV 1-33 regarding the Company's peak demand forecast methodology.

- a. Please provide the functional form and variables included in the final model.
- b. Please provide the functional form and variables included in all other models tested by the Company.
- c. Please provide the underlying model input data used to produce the Company's forecast.
- d. Please provide the model outputs for the Company's forecast. Include all estimated coefficients, standard errors, and goodness-of-fit statistics (such as MAPE, standard error of the estimate).
- e. For each year 2019, 2020, and 2021, please provide the standard error of the forecast value and identify whether the Company's minimum, target, or maximum peak demand savings fall within the standard error. Please show your calculations.

Response:

- a. The functional form and variables in the final model is:

Peak (summer MW, before DERs) = x_1 * Number of Rhode Island Households (indexed: January, 2017 = 100) + x_2 * Year_2015 (dummy: 0 or 1) + intercept, where:

$$x_1 = 36.174$$

$$x_2 = 62.323$$

$$\text{intercept} = -1588.778$$

The historical observations used to specify the model include the annual summer peaks for years 2004 through 2017.

- b. The functional form of the other models tested is similar to the model in part a. above; however, other independent variables are used in place of the "number of households" and year_2015 as follows:

Rhode Island Gross Domestic Product (indexed)

Rhode Island Employment, non-manufacturing (indexed)

Rhode Island Employment, manufacturing (indexed)

Rhode Island Population (indexed)
Narragansett Energy Consumption (before DERs)

- c. Attachment DIV 8-7-1 contains the underlying input data used to produce the Company's forecast.
- d. Attachment DIV 8-7-1 and Attachment DIV 8-7-2 contain the model outputs for the Company's forecast. Attachment DIV 8-7-1 contains model outputs for the individual historical observations and future predicted values. Attachment DIV 8-7-2 contains the requested statistics for the overall model.
- e. Attachment DIV 8-7-1 contains the forecasted values and standard errors for the years 2019, 2020, and 2021, as well as the Company's targets. Only the minimum target for 2019 is below the forecast standard error. However, note the proposed targets are measured relative to the peak for the prior year, and not the forecast.

(This response is identical to the Company's response to Division 25-7 in Docket No. 4770.)

Division 8-8

Request:

Please state how frequently the Company develops internal forecasts for system peak demand.

Response:

The Company develops internal forecasts for system peak demand on an annual basis.

(This response is identical to the Company's response to Division 25-8 in Docket No. 4770.)

Division 8-9

Request:

Please provide the Company's ten most recent system peak demand forecasts (e.g., forecasts of vintage 2008 through 2017). If the Company forecasted DER impacts on peak demand, please include those estimates as well. If the data are not available in the format requested, please provide the data that most closely matches that requested. Please provide the data in electronic format.

Response:

Attachment DIV 8-9 contains the ten most recent peak demand forecasts, including DER (energy efficiency and solar PV) impacts for the years in which those impacts were considered.

(This response is identical to the Company's response to Division 25-9 in Docket No. 4770.)

Division 8-10

Request:

Please state how frequently the Company develops internal forecasts for distribution system peak demand (e.g., individual substation peaks).

Response:

The Company develops a state-wide internal forecast once per year. The state-wide forecast has some granularity to a power supply area level. The power supply area growth rates are applied to distribution circuits to develop distribution-level feeder projections once per year.

(This response is identical to the Company's response to Division 25-10 in Docket No. 4770.)

Division 8-11

Request:

Please provide the Company's three most recent granular distribution-level peak forecasts (e.g., for substations or circuits), as well as any forecasts of energy efficiency and other DERs' impact on distribution peaks. Please provide the data in electronic format.

Response:

The Company's three most recent granular distribution-level peak forecasts are included as Attachment DIV 8-11-1, Attachment DIV 8-11-2, and Attachment DIV 8-11-3. As described in the Company's response to Division 8-10, these are feeder peak projections based on a state-wide forecast. The state-wide forecast includes reductions for energy efficiency and distributed generation.

(This response is identical to the Company's response to Division 25-11 in Docket No. 4770.)

Division 8-12

Request:

Please refer to the proposed Monthly Transmission Peak Demand Reduction metric as described in Schedule PST-1, Chapter 9 – Performance.

- a. Has the Company developed a monthly transmission peak forecast to use as a baseline in the Monthly Transmission Peak Demand Reduction metric? If so, please provide the forecast in an electronic file with formulas intact.
- b. If the Company has not yet developed such a forecast, please state whether the Company intends to develop a monthly transmission peak forecast to use as its baseline.
- c. If the Company does not intend to develop such a forecast, please explain why it does not feel a monthly transmission peak forecast is necessary as a baseline.

Response:

- a. The Company has not developed a monthly transmission peak forecast to use as a baseline for Monthly Transmission Peak Demand Reduction.
- b. The Company is evaluating options for developing a monthly forecast in support of this metric. The Company believes a forecast based on historic relationships of monthly to annual peaks should be sufficient to support this metric.
- c. Please see the response to part b. above.

(This response is identical to the Company's response to Division 25-12 in Docket No. 4770.)

Division 8-13

Request:

If the Company has developed a monthly transmission peak forecast for its Monthly Transmission Peak Demand Reduction metric, please answer the following.

- a. Please provide the functional form and variables included in the final model and all other models tested by the Company.
- b. Please provide the underlying model input data used to produce the Company's forecast.
- c. Please provide the model outputs for the Company's forecast. Include all estimated coefficients, standard errors, and goodness-of-fit statistics (such as MAPE, standard error of the estimate).
- d. For each year 2019, 2020, and 2021, please provide the standard error of the sum of the monthly forecasts less the highest monthly peak (or the metric that the Company proposes to use to measure performance). Please show your calculations.

Response:

The Company has not developed a monthly transmission peak demand forecast. Therefore, the Company is unable to provide the information requested in parts a. through d.

(This response is identical to the Company's response to Division 25-13 in Docket No. 4770.)

Division 8-14

Request:

Refer to response to DIV 1-34 regarding the Company's transmission peaks.

- a. Please provide the actual monthly peak load for years 2007 through 2017. Please provide the data in electronic format (e.g., in an Excel file).
- b. Please confirm that the Company has not yet performed a weather normalization of its historical monthly peak demands for use as a baseline. If the Company has performed a weather normalization, please provide the weather-normalized historical monthly peak demand information. Please provide the requested data in electronic format (e.g., in an Excel file).
- c. Please provide the data (e.g., degree days and humidity) that the Company expects it would use to calculate weather-normalized monthly peak demand. Please provide the data in electronic format (e.g., in an Excel file).
- d. Please confirm that the Company's proposal for the transmission peak PIM metric is the annual sum of 12 months peak demands, less the maximum month.
- e. Please confirm that the 12-month sum of monthly transmission peaks less the maximum peak for 2012 through 2017 ranged from 9,053 MW to 14,826 MW, a difference of 5,773 MW.
- f. Given the significant range in the sum of the monthly peak demands (less the maximum month) over the last 5 years, and the fact that the Company has not calculated the weather-normalized monthly peaks, please state whether it can be established with a reasonable degree of certainty that the targets for this PIM were achieved due to utility actions. If not, please explain how the PIM could be modified in order to provide greater certainty that the targets were achieved through utility action.

Response:

- a. Please see Attachment DIV 8-14-1.
- b. The Company has not performed a weather normalization of its historical monthly peak demands.
- c. Please see Attachment DIV 8-14-2.

- d. The Company's proposal for the Monthly Transmission Peak Demand metric is the annual sum of 12 months peak demands, inclusive of the maximum month. These targets are intended to capture additional incremental effort by the Company to reduce peak demand outside of the annual peak month.
- e. That is not correct. The correct range for the calculation described in part e. of the data request for the years 2012-2017 is 13,906 MW to 14,826 MW, a difference of 919 MW. These calculations are included in Attachment DIV 8-14-1.
- f. Please see the response to part e.

(This response is identical to the Company's response to Division 25-14 in Docket No. 4770.)
