BY HAND DELIVERY AND ELECTRONIC MAIL

Luly E. Massaro, Commission Clerk Rhode Island Public Utilities Commission 89 Jefferson Boulevard Warwick, RI 02888

RE: Docket 4979 – The Narragansett Electric Company d/b/a National Grid 2020 Energy Efficiency Program Plan
Responses to PUC Data Requests – Set 1

Dear Ms. Massaro:

In response to Commission counsel's request, I have enclosed 11 copies of National Grid's¹ responses to the Public Utilities Commission's (PUC) First Set of Data Requests in the above-referenced docket by PUC Request in sequential order with bates numbering.

Thank you for your attention to this filing. If you have any questions, please contact me at 781-907-2121.

Sincerely,

Raquel J. Webster

Enclosures

cc: Docket 4979 Service List Jon Hagopian, Esq. John Bell, Division

¹ The Narragansett Electric Company d/b/a National Grid (National Grid or Company).

PUC 1-1

Request:

Please update the response to COMM 1-1 in Docket No. 4888 to include the current proposal.

Response:

COMM 1-1 in Docket. 4888 has been incorporated into the 2020 Annual Plan (Plan) filed with the Public Utility Commission. The electric related portion of COMM 1-1 can be found in Plan, Attachment 5, Table E-11 (Bates 479). The gas related portion of COMM 1-1 can be found in Plan, Attachment 6, Table G-11 (Bates 490). For convenience, the Company has also included Tables E-11 and G-11 as Attachments PUC 1-1-1 and PUC 1-1-2.

Notes:

(2) Prior to 2017, Spending Budget Eligible for Shareholder Incentive includes: Implementation, Administration, General, and Evaluation Expenses; excludes EERMC and OER Costs, Commitments, Copays, and Outside Finance Costs. Beginning in 2017, Outside (1) Energy Efficiency Budget includes total expenditures and commitments. Includes all demand side management program-related expenses, including rebates, administration and general expenses, evaluation, commitments for future years and Company incentive.

Finance Costs were also included. Beginning in 2018 Pilot expenses were also excluded. Beginning in 2019 ConnectedSolutions expenses and assessment were also excluded.

(3) Actual Expenditures is actual spend during calendar year. Includes expenditures and commitments. Includes all demand side management program-related expenses, including rebates, administration and general expenses, evaluation, commitments for future years

(4) Gas programs began during July 2007 and were not reported on separately that year since programs were still in development. The 2007 gas programs are included in 2008 reporting. Systems Benefit Charge shown for 2007 is the weighted average of \$0.063 per decatherm from January 1, 2007 - June 30, 2007 and \$0.107 per decatherm from July 1, 2007 through December 31, 2008.

(5) On July 25, 2011 the Commission ordered that National Grid could increase the gas System Benefits Charge from \$0.15 to \$0.411 per decatherm for the period of August 1, 2011 through December 31, 2011. Annual cost represents 7 months usage (632 therms) at

\$0.015 per therm and 5 months usage (214 therms) at \$0.0411 per therm.

(6) In the Company's gas and electric rate cases in docket 4323, the PUC approved the uncollectibles gross-up in the electric EE Program Charge effective February 1, 2013, and a new rate applicable to the gross-up of the gas EE Program Charge, effective February 1, 2013.

(7) 2019 values are planned.

(8) Redocts and are proposed armings Tax.

(9) Reflects the annual cost including Gross Earnings Tax.

(10) Reflects the annual cost including Gross Earnings Tax.

(11) The Gas EE Program Charge was uniform for all customers until 2014, at which time the Company proposed and the PUC approved individual factors for the residential and C&I sectors.

PUC 1-2

Request:

Please update the response to COMM 1-2 in Docket No. 4888 to include the current proposal.

Response:

Please see Attachment PUC 1-1-1 and PUC 1-1-2 in response to PUC 1-1.

PUC 1-3

Request:

Were there any programs and/or measures that were offered in the 2019 EE Plan that are not being offered in 2020 EE Plan? If yes, please identify and explain.

Response:

There were no programs that were offered in the 2019 EE Plan that are not being offered in the 2020 EE Plan.

The following measures were offered in the 2019 EE Plan and are not being offered in the 2020 EE Plan:

- In the residential Energy Star HVAC program, the following measures were offered in 2019 but removed in 2020; Oil Fuel Switching and Oil Fuel Switching ROF. These measure offerings have been replaced with the added level of detail showed in the added measure section for this program.
- For the Residential ConnectedSolutions program, the following measures were removed for 2020: EVs Peak This measure is no longer offered in Rhode Island due to possible interference with the EV Time of Use Program evaluation.
- Water Heater Daily This measure is not offered in Rhode Island due to low cost effectiveness and safety concerns around legionnaires disease.
- In the Commercial and Industrial sectors, the following measures were removed for 2020: Large Commercial Gas New Construction Program - WATER HEATER - ON-DEMAND 82, WATER HEATER - ON-DEMAND 90, WATER HEATER TANK 0.67 EF, Water Heating Boiler - 85% TE. These measures have been replaced with higher efficiency measures.
- Large Commercial Electric New Construction Program Upstream HVAC ECM Fan has been removed from the 2020 offering. This measure is now required by building code and can no longer be supported with energy efficiency incentives.

PUC 1-4

Request:

How is the 2020 EE Plan different for low-income ratepayers compared to the 2019 EE Plan?

Response:

The 2020 EE Plan for serving low-income ratepayers incorporates enhancements set forth in the 2019 Process Evaluation. The key changes for 2020 are as follows:

- Developing and implementing a mobile App-based non-sWs (Standard Work Specification) based assessment process for the National Grid Income Eligible Services (IES) program to improve administrative efficiencies for auditors.
- Establishing key performance indicators to better measure the performance of the IES program.
- Improving Contractor Management including standardizing contractor recruitment, selection and payment to encourage all qualified contractors to participate in the IES program.
- Improving the survey process to obtain greater customer feedback on AMP, weatherization and heating system replacement processes.
- Improving Assessor capacity including enhanced recruitment, training and career opportunities for all energy assessment positions with a goal of providing long term, equitably compensated opportunities to diverse communities.

PUC 1-5

Request:

Please provide a list of what specific decisions National Grid is seeking from the PUC.

Response:

The Company respectfully requests that the PUC approve the 2020 Annual Energy Efficiency Plan in its entirety. Specifically, the Company requests that the PUC approve the following:

- The total electric and gas spending budgets listed in Tables E-2 and G-2, located at Bates pages 467 and 481, respectively.
- The associated electric and gas savings goals listed in Tables E-7 and G-7, located at Bates pages 475 and 488, respectively.
- All proposed programs, pilots, demonstrations, and assessments contained therein.
- Proposed modifications to the performance incentive structure, including the addition of a delivered fuels carve-out mechanism and incremental performance incentive adjustment mechanisms related to the relationship between sector level planned and actual spend, as outlined at Bates pages163-169.

PUC 1-6

Request:

Referencing the prefiled joint testimony of Porter and Ray (Joint Testimony) on Bates page 21, please explain how the incentive for all-electric homes accomplishes the promotion of fossil-fuel-free new construction.

Response:

The incentive for the all-electric homes will help to guide project teams to design and build fossil-fuel free homes that will support Rhode Island's Greenhouse Gas goals. The all-electric home will consist of electric heat, cooling, hot water heating, and appliances. The all-electric home incentive will promote fossil-fuel-free new construction by helping customers offset the potentially higher up-front construction costs of all-electric homes.

PUC 1-7

Request:

Referencing the Joint Testimony on Bates page 38, please explain the nature of the "test" of instant-rebates, what data will be collected, and how that data will be used. Please also explain if this test is part of a pilot, demonstration, or assessment.

Response:

The test of instant-rebate processing will not be a pilot, demonstration, or assessment. If feasible, the instant-rebate processing will be another channel that customers can access for energy efficiency incentives when purchasing ENERGY STAR® consumer products. The language "test" was used since there is uncertainty whether the Company will be able to deploy the technology needed to offer instant rebates to customer within the program year. If implemented, the Company will look at customer use of the instant rebate channel versus other existing channels and customer satisfaction with the instant rebate offering.

PUC 1-8

Request:

Referencing the Joint Testimony on Bates page 44, please explain when the PUC would review the justification of CHP projects greater than 1 MW generally. Will this review include a project-specific cost-benefit analysis, or does the project-specific analysis happen later?

Response:

Pursuant to the Company's proposal as outlined on Bates page 328 of the 2020 Energy Efficiency Plan the Company will provide notification to the Division of Public Utilities and Carriers (the Division), the Office of Energy Resources, and the Energy Efficiency and Resource Management Council of any CHP project with a net output of 1 MW or greater. The notification will occur after the project-specific cost benefit screening has been completed and before the offer letter is presented to the customer.

At that point, the Company will also submit specific additional documentation and supporting materials to the Division for its review including a project description, documentation related to the energy efficiency technical assistance and incentives, a natural gas capacity analysis, and a complete benefit cost analysis for the CHP project using the Rhode Island Test and an application of this test applying sensitivities related to the removal of economic benefits. Upon receipt of this information, the Division may then submit information requests to the Company.

If, at the end of fifty days from the date the Company provided notification to the Division, the Division has not provided the Company or the PUC its opinion of support or opposition to the project, the Company would retain the right to make a filing with the PUC seeking approval of the CHP project. At that time, the PUC would have an opportunity to review the project and a project-specific cost-benefit analysis included in the Company's filing.

In the event that the Division provides its opinion to the PUC that the Division supports the CHP project, the Company must file a notification with the PUC setting forth the pertinent facts relating to the project, including a project-specific cost-benefit analysis. At that time, the PUC will have the opportunity to approve or reject the project.

However, if the PUC takes no action within thirty days of the Company's notification and the Division (or any other party) has not objected to the proposed project, the project will be deemed approved.

Alternatively, if the Division (or any other party) objects to the project, the PUC will set the matter for a public hearing.

PUC 1-9

Request:

Is the new proposal for review of CHP projects greater than 1 MW also being proposed for other large projects?

Response:

No, the newly proposed review process for CHP projects greater than 1 MW is specific to CHP projects.

PUC 1-10

Request:

Referencing the Joint Testimony on Bates page 46, lines 10 to 12 please provide the early market assessment the witnesses are referring to.

Response:

The term "market assessment" on Bates Page 46 was used imprecisely. In 2018 and 2019, the Company conducted an informal assessment of the market interest in Zero Energy Buildings (ZEB) by gathering data on potential projects in Rhode Island. Data was gathered from National Grid sales team, National Grid vendors, local architects, and developers. This assessment was not a comprehensive survey of all architects and vendors, but more anecdotal information gathering to determine interest levels.

The Company gathered the following information:

National Grid Sales team:

- School districts interested in two potential New Construction ZEB school projects
- University interested in ZEB project

National Grid Vendors:

Multifamily Projects:

- In 2018: 30-unit building* (currently in planning phase), 7-unit building (currently under construction)
- In 2019: 48-unit project comprised of 3 buildings (currently in final design phase)

Municipality Projects:

- Three building projects under Providence Parks department are interested in ZEB and electrification

City of Providence Re: Power PVD "Race to Zero" Challenge Initiative 2019 Participants include:

- Zero Energy Small Home Community
- Education Facility, Roger Williams Zoo
- 30-unit multifamily project*

^{*}Multifamily projects listed under "City of Providence" and under "Multifamily Projects" are the same project.

PUC 1-11

Request:

Referencing the Joint Testimony on Bates page 56, line 4, please explain the "changing rebate policies" referenced by the witnesses.

Response:

Annual energy-saving targets are developed through a stakeholder engagement process, where factors such as product maturity, penetration of the market, state policy goals, and observed and anticipated customer receptiveness to specific offers and measures are considered when developing targets.

Rebate levels are determined in tandem with the saving targets and are set at levels deemed necessary to remove the customer cost barrier associated with energy efficient products without paying more than is necessary to drive customer adoption at targeted levels.

Evaluations assist with benchmarking rebate levels and ensuring that rebates are reasonable and in line with appropriate comparable rebates from other jurisdictions. Factors that may impact changes in rebate level include increases or decreases in the cost of efficient products, changes to savings targets for specific measures or products, and observations of market penetration, product maturity, or trends in customer adoption of incentivized technologies or measures.

PUC 1-12

Request:

Please provide National Grid's estimate for the number of heat pumps that were installed in 2018 and to-date in 2019 that *could have* taken advantage of National Grid's delivered fuels heat pump programs. What portion of this estimated number of heat pumps is attributable to, or participated in, the 2018 and to-date 2019 program, if known?

Response:

The number of heat pumps incentivized for cooling and for delivered fuel heating system displacement are outlined in the table below. The Company does not have visibility into air source heat pump installations completed outside of incentive programs.

Customers who participated in the standard air source heat pump incentive are gas customers and/or chose to cool/heat a room or an isolated area, as opposed to partial/full displacement or full house heating system.

The ASHP displace/replace oil/propane/electric heat incentive was introduced in November 2018 and made available to customers with oil, propane or electric resistance heat to displace/replace a delivered fuel or electric resistance heating source.

It is unknown what portion of customers who participated in the 'standard' air source heat pump incentive (i.e. those who chose not to do a full/partial displacement of an existing heating system) could have participated in the larger incentive to displace/replace oil/propane/electric heating source, as there are several potential variables that could impact customer participation, including:

- Customer has natural gas for heating fuel therefore not eligible for heating system displacement or replacement;
- Customer may not have wanted to replace existing heating system;
- Customer only wants small area (i.e., one room) served;
- Customer's contractor may not have been an approved contractor at time of heating system replacement.

PUC 1-12, page 2

Incentive Description	2018 11/1/18 – 12/31/18	2019 01/01/19 – 11/20/19
	# of incentives	# of incentives
Standard ASHP Incentive	1330	921
ASHP to displace/replace oil/propane/electric heat incentive	18	287

PUC 1-13

Request:

The Three-Year Energy Efficiency Plan provided targets that, at the time, included a need for National Grid to innovate savings to meet the targets. Please explain if that innovation was necessary and specifically how it was accomplished.

Response:

The Company defines innovation as any new technology, go-to-market strategy, pilot or process that may contribute to the achievement of all cost-effective energy savings. This includes innovation within existing programs based on new technologies, new measures, and new ideas from vendors that achieve a broader reach to customers, as well as to innovation through pilots, demonstrations and assessments.

Innovations as described above have been, and remain, necessary to achieving savings targets.

In the 2018-2020 Three Year Plan, a Future Innovation Adder of approximately 25,500 Annual MWh was included in 2019 in order to illustrate a potential path to the Company's achievement of specified saving targets. This Annual MWh adder was not planned to be met by any specific technological innovation, but instead has been addressed by expanding and innovating with program access, developing pathways to meeting additional demand for lighting savings, and in offering new services to customers where data has pointed to tangible savings opportunities.

Innovation is accomplished within the Company's delivery of EE programs and services through a process of continuous improvement.

Examples of some of the specific areas where this process has led to innovations that contributed to Company realization of incremental savings include:

- Improvements to EnergyStar Lighting program marketing and delivery, resulting in an anticipated 88% increase in the volume of incented products in 2019 vs. 2018. Even with a lower net-to-gross ratio than predicted, the Company believes that this increase in the volume of lighting products will lead to higher projected savings in 2019 compared to the Three-Year Plan (please see Attachment 1, Page 43, Bates page 223).
- A new 4th Tier in the Residential New Construction program for High Efficiency Homes
- Expanded Air Source Heat Pump (ASHP) incentive offerings
- 100% landlord incentives within the EnergyWise program
- Within the Commercial & Industrial sector, the launch of a restaurant initiative under the small business program, as well as proposed plans to offer a lodging initiative as well as a laundry initiative in 2020.

PUC 1-13, page 2

Innovation is also accomplished within the Company's pilots, demonstrations and assessments. Examples of innovation via this process include:

- Demand Response Pilot The Company, as part of its pilots efforts, tested commercial and residential active electric demand response in 2017 and 2018. The Company launched active electric demand response as a full program in 2019. This program, in the two summer seasons it has been operational, has performed above goals and is anticipated to achieve continued success.
- Commercial & Industrial demonstrations that are underway in 2019, and show promise to contribute savings in 2020 and beyond including Strategic Energy Management and Accelerate Performance.

PUC 1-14

Request:

Referencing Bates page 188 of the Plan, what does "moderate income" mean? Are there landlords who are not eligible to receive the 100% landlord incentive because of the financial status of their renters?

Response:

The Company has used the term moderate income to refer to customers whose household income falls within a range of 60-100% of area median income (AMI).

The 100% landlord incentive is not dependent on the financial status of the renters. Please see Attachment PUC 1-14 for a copy of a flyer the Company provides to landlords which includes participation qualifications.

Increase efficiency. Increase comfort. See savings.

Landlords: receive 100% off insulation (up to \$4,000)

National Grid offers solutions to improve the energy efficiency of your rental units and help keep your tenants happy.

We currently offer residential customers living in a 1-4 unit dwelling an instant incentive of 75% (up to \$4,000) for approved insulation improvments. As a special incentive for you, National Grid is waiving the 25% co-pay for rental units. Your tenants will enjoy a more comfortable home and lower energy bills.

It all starts with a no-cost Home Energy Assessment
The on-site visit identifies energy efficiency opportunities.
Performed by a qualified Energy Specialist, you'll get
a custom energy report outlining energy efficiency
recommendations, next steps, and rebates and
incentives.

Available rebates and incentives

No-cost energy savings products installed during the assessment may include:

- ENERGY STAR® LED light bulbs
- Advanced power strips
- Low-flow showerheads
- Faucet aerators
- Programmable thermostats or discounted wireless thermostats (installed at a second appointment)

The assessment determines if you qualify for other rebates and incentives, such as:

- No-cost air sealing of leaks in drafty areas
- 100% off recommended insulation improvements (up to \$4,000), per unit
- Rebates on heating and cooling equipment and water heaters
- The opportunity to apply for zero percent financing

Landlord qualification

Tenant must have a National Grid Electric or Gas account

- Must obtain a copy of the lease to keep on file
- Must be a year round lease, no summer rentals
- Must be in a 1-4 unit dwelling

Landlord occupied units may also qualify for 100% (up to \$4,000) when insulation improvements are done in conjuction with all other rental units.

Tenants

If you are a residential tenant interested in any of National Grid's energy efficiency programs, we recommend working with your landlord to determine which improvements are the best fit. A conversation today may lead to a greener and more efficient home tomorrow!

1-888-633-7947 EnergyWiseInfo@RISEengineering.com

PUC 1-15

Request:

Referencing pages 189-90 of the Plan, what are the "enhanced incentives" that are offered to customers with homes meeting the optimal building design and heating fuel type for electrification of the heating and water heating systems? Please also describe the standards used to determine that a home meets the optimal building design and heating fuel type for electrification of the heating and water heating systems.

Response:

The enhanced incentives refer to the Electrification of Heat and Hot Water incentives identified on Bates page 231. During the in-home Home Energy Assessment, energy specialists can identify housing configurations that would benefit from electrification of heat and/or hot water on the basis of housing attributes including well-insulated building envelopes and existing heating fuel type. Energy specialists will recommend high efficiency air source heat pumps if the home is suitable for the high efficiency air and/or water heating systems.

In 2020, the optimal building configurations for air source heat pumps will be developed within the High-Efficiency Heating, Cooling and Hot Water program and will allow for air source heat pumps to be successfully retrofitted and meet consumer expectations as their primary heating source.

PUC 1-16

Request:

Attachment 1, Table 2. Please provide a short (i.e., about one sentence) description of each measure, including a description of how it saves electricity relative to a baseline technology. Please note if the measure only saves delivered fuels.

Response:

Please see Attachment PUC 1-16 for the above requested information.

		- Electric Programs	
Program	Measure	Measure Description	Only Saves Delivered Fuels
	AC Timer	The installation of an air conditioner timer that provides ability to switch on and off an airconditioner. There is no savings claimed for this measure.	0
	Aerator - Electric	The installation of a low flow faucet aterator. Savings are acheived by replacing an existing high flow rate faucet aerator with a low flow faucet aerator. No	0
	Aerator - Oil	The installation of a low flawet acrator. Savings are acheived by replacing an existing high flow rate faucet acrator with a low flow faucet acrator. Yes	es
	Aerator - Others	The installation of a low flow faucet aerator. Savings are acheived by replacing an existing high flow rate faucet aerator with a low flow faucet aerator. Yes	es
	Air Sealing Kit - Oil	The installation of recessed lighting cans that provide air sealing benefits. Savings are achieved by replacing leaky recessed lighting cans in the participating household	es
	Air Sealing Kit - Electric	The installation of recessed lighting cans that provide air scaling benefits. Savings are achieved by replacing leaky recessed lighting cans in the participating household	0)
	Air Sealing Kit - Others	The installation of recessed lighting cans that provide air sealing benefits. Savings are achieved by replacing leaky recessed lighting cans in the participating household	es
	LED Bulbs		0
	LED Bulbs (EISA Exempt)	The installation of ENERGY STAR rated Light-Emitting Diode (LED) screw-in bulbs. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs.	O
	LED Bulbs Reflectors	The installation of ENERGY STAR rated Light-Emitting Diode (LED) reflector bulb. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs.	O
	LED Fixture		lo l
	LED Outdoor Fixture Pre-Wx	The mealthon of ENERGY STAR rated Light-Emitting Diode (LED) fatures. Savings are achieved by replacing existing melticent hatures. No This captures non-energy related measures such as asbestor removal or remove knob and tube wiring to make a home ready for weatherization. There is no savings datamed for this measure. No	00
	Refrigerator Rebate	The installation of high efficiency refrigerator. Savings are achieved by replacing existing inefficient refrigerator with a new refrigerator. No	OJ
	Refrigerator Brush	The refrigerator brush for cleaning refrigerator coil to help refrigerator operate more efficiently. The baseline is uncleaned refrigerator coil.	0
	Showerhead - Electric	The installation of a low flow showerhead with a control that limits flow once the water is heated. Savings are based on electric heating.	0
	Showerhead - Oil	The installation of a low flow showerhead with a control that limits flow once the water is heated. Savings are based on oil heating.	es
	Showerhead - Others	The installation of a low flow showethead with a control that limits flow once the water is heared. Savings are based on propane hearing.	es
EnergyWise Single Family	Smart Strip	A state suppose data. Standy power data. No analysis of a california with a california which are california with a cal	lo o
	Programmable Thermostat - Electric	Installation of a programmance termostal, which gives the ability to adjust electric neuring or air-conditioning operating times according to a preset schedule. Baseline is a without a programable through installed.	lo
	Programmable Thermostat - Oil	Installation of a programmane intermosal, which gives the ability to adjust on rearing of air-continuing operating times according to a present schedule.	O
	Programmable Thermostat - Other	Installation of a programmable thermostat, which gives the ability to adjust propane heating or air-conditioning operating times according to a preset schedule.	O
	LED Torchiere Ventilation - Other	The installation of ENERGY STAR rated LED torchieres. Savings are achieved by replacing the existing inefficient fixture with an efficient one. No The installation of ventilation to maintain appropriate ventilation after weatherization is complete. There is no savings claimed for this measure.	0 0
	אווירי יווי	to meet	
	WITH THE HIGH STATE OF THE CHILC	pancy needs and	0
	WITT HETHIOSIA - AC OILLY	we to remove yages streamers were not at more. Deather it is a present the article to meet lating of Wi-Fi hermosta with the ability of a more. Deather is a short of manual termosta and programmer termonates the lating of Wi-Fi hermosta with the ability of a distinct of hearing or air-conditioning operating times according to a pre-set schedule to meet y needs and also be able to remorely adjust schedules when not at home. Baseline is a blend of manual thermostats and programable	0
	WITT LIBITIOSIAL - OII	utentionand of Wi-Fri thermostat with the ability to adjust propane heating or air-conditioning operating times according to a pre-set schedule to The installation of Wi-Fri thermostats and programable in meet occupancy needs and also be able to remotely adjust schedules when not at home. Baseline is a blend of manual thermostats and programable	0
	WiFi Thermostat - Others	thermostars. The installation of weatherization measures in oil theated homes. Sawings are acheived by applying insulation upgrades or air sealing to minimize	lo
	Wx - Oil	inflitration of outside air through cracks and leaks in the existing home shell. The installation of weapbergraphon measures in alectric heared homes. Seatines are achieved by annalyting insulation unomedies or air seating to minimize.	lo I
	Wx Elec - Elec Heat Only	The institution of outside air through cracks and leaks in the existing home shell. No	lo
	Pipe Insulation - Electric	The installation of domestic hot water pipe with 10 reduce electric water healing. Savings are achieved by applying institution in existing equipment without pipe insulation.	O.
	Pipe Insulation - Oil	The installation of domestic not water pipe wrip to reduce of twater bearing. Savings are achieved by applying insulation in existing equipment without pipe insulation. Yes	es
	Pipe Insulation - Others	The mistaliation of domestic not water pipe wrap to reduce propane water heating, savings are actived by applying insulation in existing equipment without pipe insulation. Yes	es
	Participants	This measure tracks program participation and does not have an associated energy savings value. This is not a measure but is the Heat Loan budget for this program and included in the Rehates and Other Incentives budget for this program listed in	lo
	Heat Loans		//A

Electric Programs	Measure Description	Energy efficiency code trainings and advocacy work to improve energy efficiency of buildings and equipment within Rhode Island. Savings are claimed by increasing the percentage of code compliant residential homes.	Electric sorings resulting from Energy Star Homes Code Plus projects which have a custom max of measures and improvements. Code Plus projects are positioned below Tier I Energy Start Homes and above current URDH. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.	The installation of an Energy Star Clotheswasher in a Residential New Construction home. Savings are achieved by replacing a standard/inefficient clotheswasher.	The installation of an Energy Star Dishwasher in a Residential New Construction home. Savings are achieved by replacing a standard/inefficient dishwasher.	The installation of ENERGY STAR rated Light-Emitting Diode (LED) fixtures. Savings are achieved by replacing existing inefficient fixtures.	The installation of ENERGY STAR rated Light-Emitting Diode (LED) screw-in bulbs. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs.	Electric swings resulting from Renovation Relab Code Plus projects which have a custom mix of measures and improvements. Renovation Relab Code Plus projects are positioned below Terr I Renovation Relab projects and above current URDH. This measure saves energy by increasing the efficiency when compared to the base case of the URDH.	The installation of high efficiency refrigerator. Savings are achieved by replacing existing inefficient refrigerator with a new refrigerator.	Electric savings resulting from Renovation Rehab projects which includes a custom mix of replacement measures. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.	Electric savings resulting from Renovation Rehab projects which includes a custom mix of replacement measures. 		Electric Programs	
Program	Measure	Measure Description Only	nly Saves Delivered Fuels
	ACQIVES	s are achieved by properly installing a cer ust as needed.	
	ACS16SEER13EER	The purchase and installation of high efficiency central aur-conditioning (CAC) unit rather than a standard CAC system. The savings is achieved hrough the higher level of efficency for these units. No	
	DOWNSIZE	Reduction in system size consistent with manual J calculations for a new central AC installation. [No This installation of a high efficience read heat name, commoned to a standard heat name. Souther another through the highest least of efficiencies holy for	
	Central Heat Pump	The installation of a fight efficiency rated free pump compared to a standard free pump; savings achieved imorgal fights free for efficiency bodi for retaining and cooling.	
	Mini-Split Heat Pump	The mstaliation of a more efficient rated Ductless MiniSplit system compared to a standard mini-split heat pump. Savings achieved through higher evel of efficiencies both for heating and cooling. No	
	ECM Pumps	Heating hot water circulation retrofit projects replacing the existing hot water circulation systems with ECM pumps and zone valves. ECM pumps will work more efficiency than standard circulator pumps.	
	VIQ	Savings are achieved by properly installing a mini-split heat pump compared to a standard installation. Check to make sure refrigerant levels are correct and adjust as needed.	
		by properly installing a central ducted heat pump compared to a standard installation. Check to make sure refrigerant levels are needed.	
		running up an existing heat pump to bring the existing equipment back up to its rated efficiency. This involved changing filters ran flow to make sure it is still at the proper levels.	
	WiFi Thermostat - cooling and oil hearing	installation of Wi-Fi thermostat with the ability to adjust heating or air-conditioning operating times according to a pre-set schedule to meet occupancy needs and minimize redundant HVAC operation and also be able to remotely adjust schedules when not at home Baseline is a blend of manual thermostats and programable thermostats. Measure has both oil savings for the heating season and electric savings for cooling season.	
		installation of Wi-Fi thermostat with the ability to adjust heating or air-conditioning operating times according to a pre-set schedule to meet occupancy needs and minimize redundant HVAC operation and also be able to remotely adjust schedules when not at home. Baseline is a blend of manual thermostats and programmable thermostats. Aleasure has both gas savings for the beating season and electric savings for cooling season. No	
	>>55 gallon, UEF 2.70	Installation of a high efficiency heat pump water heater (HPWH) instead of a standard heat pump water heater. Savings achieved through the higher efficiency of the incentivized heat pump. All units must be greater than or equal to 55 gallons. No	
	Central Ducted Heat Pump Fully Displacing Furnace - Oil	The installation of a high efficiency central hear pump fully replacing an oil furnace. Savings are achieved through the higher efficiency of the central leat pump when compared to the oil furnace.	æ
		an pump fully replacing a propune fumace. Savings are achieved through the higher efficiency of the pane furnace.	
ENERGY STAR®	Central Docted Heat Pump Partially Displacing Furrace - Oil	The installation of a high efficiency central heat pump partially replacing an oil furnace. Stavings are achieved through the higher efficiency of the central lear pump when compared to the oil furnace. The existing furnace is used during extreme weather. This measure also includes integrated control that will allow the extensive to control both the oil furnace and the central heat pump using one thermostat.	20
HVAC		The institution of a high efficiency central heat pump partially replacing an propage furnes. Savings are achieved through the higher efficiency of the central heat pump when compared to the propage furnee. The existing furnee is used during extreme weather. This measure also citedudes integrated control that will allow the existence to control both the propage furnees and the central heat pump using one thermostat. Yes	8
	Central Ducted Heat Pump Partially Displacing Furnace w/o Controls - Oil	The installation of a high efficiency central heat pump partially replacing an oil furnace. Stavings are achieved through the higher efficiency of the central heat pump when compared to the oil furnace. The existing furnace is used during extreme weather. This measure does not include integrated controls and requires the extsomer to manually change from the central deceloration promp to the oil furnace and vice versa.	
	Central Ducted Heat Pump Partially Displacing Furnace w/o Controls - Propane	through the high is measure does and vice versa.	
	t Fully Displacing Boiler - Oil	The installation of high efficiency mint-split heat pumps fully replacing an oil boiler. Savings are achieved through the higher efficiency of the mini- split heat pumps when compared to the oil boiler. Yes	8
	Ductess Mini-Split Fully Displacing Boiler - Propane	The installation of high efficiency min-split heat pumps fully replacing a propane boilers. Savings are achieved through the higher efficiency of the mini-split heat jumps when compared to the propane boilers. Yes	s
	Ductless Mini-Split Replacing Electric Resistance	He installation of high etherency min-split heat pumps fully replacing a deciric resistance heaters. Savings are achieved through the higher efficiency of the mini-split heat pumps when compared to the electric resistance heating.	
	Ductess Mini-Split Partially Displacing Boiler w/o Controls - 9 Oil	The insulation of high efficiency mini-split heat pumps partially replacing an oil boiler. Savings are achieved through the higher efficiency of the mini-split hear pumps when compared to the oil boiler. The existing boiler is used during externe weather. This measure does not include integrated controls and requires the customer to manually change from the mini-split heat pumps to the oil boiler and vice versa.	8
	Ductless Mini-Split Partially Displacing Boiler w/o Controls - Propane	The maintains of high effectivency man-spitchest pumps partially replacing a propane bodier. Savings are achieved through the higher effections of the main-spit their pumps when compared to the propause bodier. The existing bodier is used during extreme weather. This measure does not include integrated countols and requires the existence namually during from the minin-spit their pumps to the propause bodier and vice versa. Yes	8
	Ductess Mini-Split Partially Displacing Boiler with Integrated Controls - Oil	The installation of ingle discissory univeptit lear pumps partially optioning an oil boiler. Savings are achieved through the higher efficiency of the min- spalls heat pumps when compared to the oil boiler. The existing boiler is used during extreme weather. This measure also includes integrated control that spall when the customer to control both the oil furnace and the mini-split heat pumps which will allow the customer more case in integrating their two heating sources.	8
	Ductless Mini-Split Partially Displacing Boiler with Integrated Controls - Propane	The mistilation of high discussive min-split heat pumps partially replacing a propiane boiler. Savings are achieved through the higher ethiciency of the mini-split heat pumps when compared to the propane boiler. The existing boiler is used during extreme weather. This measure also includes integrated control that will allow the customer to control both the propane furnace and the mini-split heat pumps which will allow the customer more case in hiergrating their two heating sources. Yes	
	HVAC Financing	This is not a measure but is the HVAC Financing for this program and is included in the Rebates and Other Incentives budget for this program listed in labe E.2.	4
	& Administration	r the program in table E-2.	4
		THIS IS NOT A INFARMATE BUT IS THE WASHINGTON UP, FORGARI II TADOR ET-2. This is not a measure but is the Sales, Technical Assistance & Training budget listed for the program in table B-2. NA	
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table E-2. [N/A]	A

		_	
Program	Measure	Meisure Description	Only Saves Delivered Fuels
	Dehumidifier Rebate	The Installation of high efficiency dehumidifiers compared to a standard efficiency dehumidifier.	No
	Dehumidifier Recycling	Removal and recycling of a old dehumidifier. Savings are based on the federal standard from approximatly 8 years ago.	No
	Energy Star Dryer	Installation of an Energy Star dryer compared to a standard efficiency dryer	No
	Freezer Recycling	The retirement of old, inefficient freezers and no replacement.	No
		A shower read adapter is attached to your chang shower read. When the shower is intrany unfector in the Ladyong device frontions are water temperature reaches bathing temperature the conservation mode is activated and the device triggers a trickle. Savings are	a
	Ladybug Electric	hased on electric water heating	No
		A showerned adapter is attached to your existing showernedd, which the shower is initially turned on the Ladyoug device infollations are water temperature reaches bathing temperature the conservation mode is activated and the device triggers a trickle. Savings are	a
	Ladybug Gas	based on gas water bearing. A physical or gas water bearing.	No

		Electric Programs	
Program	Measure	Messure Description	Only Saves Delivered Fuels
	AC Replace	Replacement of existing inefficient room air conditioners with more efficient models. Savings are acheived by replacing an existing air conditioning unit with a more efficient unit.	No
	AP Remove	The removal of inefficient refrigerator. Savings are acheived by replacing an existing inefficient refrigerator with a new efficient refrigerator.	No
	Dehumidifier Rebate	The Insulation of high efficiency debunnidifiers and the turn-in of existing inefficienci debunnidifiers. Savings are acheived by replacing an existing inefficient debunnidifier with a high efficient one.	No
		The replacement and recycling of an inefficient clothes washer/dryer with an Energy Starrated washing machine.	No
			No
	& Gas Dryer		No
	er		No
		The replacement and recycling of an inefficient clothes washer/dryer with an Energy Star rated washing machine.	No
	Early Retirement CW Propane DHW & Electric Dryer	The replacement and recycling of an inefficient clothes washer/dryer with an Energy Starrated washing machine.	No
	DHW - Electric	Domestic hot water measures include replacing high flow showetheads/faucet acrators with high-efficiency fow-flow showetheads and faucet acrators. Savings are based on electric water heating.	No
	DHW - Gas	Domestic hot water measures include replacing high flow showerheads faucet aerators with high-efficiency low-flow showerheads and faucet aerators. Savings are based on gas water heating.	No
		pplacing high flow showerheads/faucet aerators with high-efficiency low-flow showerheads and faucet aerators.	Ves
		it that includes refrigerator thermometer, LED nightlight, refrigerator coil brush and outlet/switch gaskets	
	Education - TLC	provided during an audit to help customers become more aware of energy efficiency.	No
	Fixtures	This measure is not offered in the Single Family Income Eligible Services program	No
	Freezer	This measure covers the replacement of an existing inefficient freezer with a new energy efficient model.	No
	Heating System	The installation of high efficiency heating . Savings are acheived by replacing an existing inefficient heating system with a high efficient one.	No
Single Family -	Heat Pump Water Heaters	Installation of a heat pump water heater (HPWH) instead of an electric resistance water heater.	No
Income Eligible Services	LED Bulbs	The installation of ENERGY STAR rated Light-Emitting Diode (LED) screw-in bulbs. Savings are achieved by replacing existing inefficient neardescent and halogen bulbs.	No
	ble Thermostat Gas	installation of a programmable thermostat, which gives the ability to adjust gas heating or air-conditioning operating times according to a preset chedrile.	SZ
		on of a programmable thermostat, which gives the ability to adjust oil hearing or air-conditioning operating times according to a preset	ON
	Programmable Thermostat, Oil	chedule.	No
	Programmable Thermostat, Other	installation of a programmable thermostat, which gives the ability to adjust propane heating or ar-conditioning operating times according to a preset schedule.	No
	Refrigerator rebate	This measure covers the replacement of an existing inefficient refrigerator with a new ENERGY STAR® rated refrigerator.	No
	Smart Strip	A smart strip use current sensors and switching devices which turn off plug load when devices are not in use. Savings are achieved by eliminating standby power draw.	No
	Thermostat - Electric	Installation of a programmable thermostat, which gives the ability to adjust electric heating or air-conditioning operating times according to a preset schedule. Baseline is a without a programable thermostats installed.	No
		Replacement of waterbed mattress with a standard mattress.	No
	Wx Delivered Fuel	The installation of weatherization measures in delivered the heated homes. Savings are acheived by applying insulation upgrades or air sealing to minimize inflitation of outside air through cracks and leaks in the evisting home shell.	No
	Wx Electric	The installation of weatherization measures in electric heated homes. Savings are acheived by applying insulation upgrades or air sealing to minimize mfittention of outside air through cracks and leaks in the existing home shell.	No
	Minisplit Heat Pumps - Electric Resistance	The installation of high efficiency mini-split heat pumps fully replacing a electric resistance heaters. Savings are achieved through the higher efficiency of the mini-split heat pumps when compared to the electric resistance heating.	No
	Minisplit Heat Pumps - Oil Fuel Switching	The installation of high efficiency minisplit heat pumps fully replacing an oil boiler. Savings are achieved through the higher efficiency of the mini- tolit heat pumps when compared to the oil boiler.	Yes
	Program Planning & Administration	3 & Administration budget listed for the program in table E-2.	N/A
	Marketing	This is not a measure but is the Marketing budget listed for the program in table E-2.	N/A
	Training	ole E-2.	N/A
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table E-2.	N/A

		Electric Processing	
Program	Measure	Measure Description	Only Saves Delivered Fuels
	AERATOR Elec	The installation of a low flow fancet aerator. Savings are acheived by replacing an existing high flow rate fancet aerator with a low flow fancet aerator. No	0
	AERATOR Oil	The installation of a low flow faucet aerator. Savings are acheived by replacing an existing high flow rate faucet aerator with a low flow faucet aerator. Yes	sa
	AIR SEALING ELEC WITH AC	Thermal shell air leaks are sealed through strategic use and location of air-tight materials. The baseline efficiency case is the existing building before the air sealing measure is implemented. The baseline building is characterized by the existing air changes per hour (ACHPRE).	a
	AIR SEALING OIL	Hermai shel ar teaks are eachet through stategic use and tocation of art-ught materials. The baseine efficiency case the existing building before the air sealing measures is implemented. The baseline building is characterized by the existing air charges per hour (ACHPRE). Yes	Sa
	Common Ext LED Fixture	The metallation of ENERGY STAR rated Light-Emitting Diode (LELD) axiures in outdoor common-areas. Savings are achieved by replacing existing inefficient faxtures. No	a
	Common Ext Reflector	The installation of ENERGY STAR rated Light-Emitting Diode (LED) reflector bulb in outdoor common-areas. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs. No	0
	Common Int LED Fixture	The installation of ENERGY STAR rated Light-Emitting Diode (LED) fixtures in indoor common-areas. Savings are achieved by replacing existing inefficient fixtures.	0
	Common Int Reflector	The insullation of ENERGY STAR rated Light-Emitting Diode (LED) reflector bulb in indoor common-areas. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs.	0
	Custom	Vendors install a variety of high-efficient electric measures at multifamily facilities within common areas and dwelling units. Measures include lighting, HVAC, water heating, and insulation. No	0
	Dwelling Ext LED Fixture	The installation of ENERGY STAR rated Light-Emitting Diode (LED) fixtures in outdoor dwelling units. Savings are achieved by replacing existing inefficient fixtures. No	٥
	Dwelling Int LED Fixture	The installation of ENERGY STAR rated Light-Emitting Diode (LED) fixtures in indoor dwelling units. Savings are achieved by replacing existing inefficient fixtures.	0
		Ť	0
	Heating System Retroftl-Furnace INSUI ATION EFFC WITH AC	Installation of high efficiency bearing equipment to replace existing mefficient farmace(s). No Shell insulation upgrades applied in existing facilities including improved insulation in attics, basements and sidewalls. The baseline efficiency cases have reistine brone deal in existing facilities including improved insulation in attics, basements and sidewalls. The baseline efficiency cases in any existing baseline efficiency cases.	0
)	in existing facilities including improved insulation in attics, basements and sidewalls. The baseline efficiency case is	
	INSULATION OIL Participant (NEB)	any existing fronte shell measures. This measure tracks program participation and does not have an associated energy savings value. No	Sa
	Pipe Wrap DHW Elec		0
	Pipe Wrap DHW Oil	The installation of domestic hot water pipe wrap to reduce oil water heating. Savings are achieved by applying insulation in existing equipment without pipe insulation. Yes	es
	Pipe Wrap Heating Oil	The installation of pipe wrap to reduce oil heating. Savings are achieved by applying insulation in existing equipment without pipe insulation.	Sa
	Refrig rebate	The installation of high efficiency refrigerator. Savings are achieved by replacing existing inefficient refrigerator with a new refrigerator. No	0
	SHOWERHEAD Flec	The installation of a low flow showerhead with a control that limits flow once the water is beated. Sovitos are based on electric beating.	
EnergyWise Income Eligible	e SHOWERHEAD Oil		sa
Multifamily Ketrofit	Smart Strip	A smart strip use current sensors and switching devices which turn off plug load when devices are not in use. Savings are achieved by eliminating standby power draw.	0
	Standalone WH Oil	Stand-alone storage water heaters are high efficiency water heaters that are not combined with space heating devices. The baseline efficiency case is an inefficient standalone tank water heater below a defined UEF level.	Sa
	Standalone WH Other	Stand-alone storage water heaters are high efficiency water heaters that are not combined with space heating devices. The baseline efficiency case is an inefficient standalone tank water heater below a defined UEF level. Yes	Sa
	Tankless WH Oil	Tankless water heaters circulate water through a heat exchanger to be heated for immediate use, eliminating the standby heat loss associated with a storage tank. The baseline efficiency case is a standalone tank water below a defined UEF level.	Sa
	THERMOSTAT AC Only	Installation of a programmable thermostat, which gives the ability to adjust air-conditioning operating times according to a preset schedule. Baseline is a without a programable thermostats installed. No	0
	THERMOSTAT Elec with AC	Installation of a programmable thermostat, which gives the ability to adjust electric heating or air-conditioning operating times according to a preset schedule. Baseline is a without a programable thermostas installed. No	0
	THERMOSTAT Heat Pump	Installation of a programmable thermostat, which gives the ability to adjust electric heating or cooling operating times of a heat pump according to a preset schedule. Baseline is a without a programable thermostats installed.	0
	THERMOSTAT OIL	Installation of a programmable thermostat, which gives the ability to adjust oil heating or air-conditioning operating times according to a preset schedule. Yes	sa
	TSV Showerhead Flee	The high efficiency measures is a thermostate shufor two common with a low thin who wenteded. The baseline is a faceral code showerhead., Savings is realized due to the combination of a reduction in hot waster usage associated with the shut valve associated with a person waiting for the Ashowertem to heat un and the lower flowarte associated with the low flow showerhead. No	
	Common Int ElSA Exempt	The installation of ENERGY STAR rated Light-Emitting Diode (LED) screw-in bulbs in indoor common areas. Savings are achieved by replacing existing inefficient incordescent and halogen bulbs.	0 0
	Dwelling Ext Reflector	The installation of ENERGY STAR rated Light-Emitting Diode (LED) reflector bulb in outdoor dwelling-units. Savings are achieved by replacing existing inefficient incandescent and halozen bulbs.	
	Dwelling Int EISA Exempt		0
	Dwelling Int Reflector	The installation of ENERGY STAR rated Light-Emitting Diode (LED) reflector bulb in indoor dwelling-units. Savings are achieved by replacing existing inefficient incardescent and halogen bulbs. No	٥
	Common Ext LED Bulbs	Y STAR rated Light-Emitting Diode (LED) screw-in bulbs in outdoor common-areas. Savings are achieved by replacing scent and halogen bulbs.	٥
	Common Int LED Bulbs	The installation of ENERGY STAR rated Light-Emitting Diode (LED) screw-in bulbs in indoor common-areas. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs. No	0
	Dwelling Int LED Bulbs	The installation of ENERGY STAR rated Light-Emitting Diode (LED) screw-in bulbs in indoor dwelling units. Savings are achieved by replacing existing inefficient incandescent and halogen bulbs. No	0
	Vonding Misse	educe the energy consumption of vending machine lighting and refrageration systems. The baseline beverage vending machine without a control system capable of powering down lighting and	
	Ventuing retiser Participants	retrigeration systems utuning between or intercepts. This measure tracks program participation and does not have an associated energy savings value. No	0 0

		Electric Programs	
Program	Measure	Measure Description	Only Saves Delivered Fuels
	Program Planning & Administration	This is not a measure but is the Program Planning & Administration budget listed for the program in table E-2.	N/A
	Marketing	This is not a measure but is the Marketing budget listed for the program in table E-2.	N/A
	Sales, Technical Assistance & Training	This is not a measure but is the Sales, Technical Assistance & Traning budget listed for the program in table E-2.	N/A
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table E-2.	N/A
	Thermostats New	Peak loads are reduced by increasing the thermostat settings during peak hours of peak days. Nine different thermostat manufacturers are currently supported in this BYOD (Bring Your Own Device) program. Customers can op our of the program or individual events at any time.	No
	Thermostats Existing	Peak loads are reduced by increasing the thermostat settings during peak hours of peak days. Nine different thermostat manufacturers are currently supported in this BYOD (Bring Your Own Device) program. Customers can opt out of the program or individual events at any time.	No
Residential	Battery Daily (number of unit)	Peak loads are reduced by discharging battery systems during peak hours of peak days. Five different battery integrators are currently supported in their BYOD (Bring Your Own Device) program. Customers can opt out of the program or individual events at any time.	No
ConnectedSolutions	EVs Peak (customers)	This measure is no longer offered in Rhode Island due to possible interference with the EV Time of Use Program evaluation.	No
	Water Heater Daily (units)	This measure is not offered in Rhode Is land due to low cost effectiveness and safety concerns around legiomaires disease.	No
		Peak loads are reduced by emaining all residential and small'medium business customers with an email on the to ask them to voluntarily reduce electricity use at peak times by doing things such as delaying when they run dish washer, clothes dryers, and clothes washers until after peak hours on	
	Behavioral Peak (customers)	peak days.	No
	Program Planning & Administration	This is not a measure but is the Program Planning & Administration budget listed for the program in table E-2.	N/A
	Marketing	This is not a measure but is the Marketing budget listed for the program in table E-2.	N/A
	Sales, Technical Assistance & Training	This is not a measure but is the Sales, Technical Assistance & Traning budget listed for the program in table E-2.	N/A
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table E-2.	N/A

PUC 1-17

Request:

Attachment 1, Table 3. Please provide a short (i.e., about one sentence) description of each measure, including a description of how it saves natural gas relative to a baseline technology. Please note if the measure only saves delivered fuels.

Response:

Please see Attachment PUC 1-17 for the above requested information.

Because measures listed in Table 3 refer to natural gas program level measures, none of the measures listed only save delivered fuels.

Boiler Reset Boiler90 Boiler90 Combo Condensing 95 Energy Star Cond Water Heater 0.80 UEF Furnace95 ECM Furnace97		Bonter reset controls are devices that improve the efficiency of an existing boiler system by modulating the hot water temperature sets of no auditor temperature using a software program; load controls sense the thermal demand of the heating system and resets the water temperature based on outdoor temperature using a software program; load controls sense the thermal demand of the internal effects of the state of the demand. The high efficiency case is a boiler with an AFUE greater than or equal to 90% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiescy. The high efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiescy. The high efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiescy. The high efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiescy. The high efficiency condensing water heater replacing a federal code gas water heater. Savings is due to the increase in efficiency space heating gas-fired furnace greater than or equal to 95% AFUE with an electronically commutated motor (ECM) for the fan. baseline is an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace with an encounter of the increase of electricity consumed by the system fans. The baseline is an 85% as stand-alone ga
		Bond reset ountols are devices that improve the Educacion you aciding boiler system by modulating the bot water temperature based on audiorized per part and aciding system and reacts the water temperature based on audiorized the sing a software program; load controls sense the thermal demand of the beating system and reacts the water temperature based on the demand. The high efficiency case is a boiler with an AFUE greater than or equal to 90% while the baseline has an AFUE of 85%. The savings is due to an mercase in efficiency case is a combo-boiler with an AFUE greater than or equal to 90% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency. The high efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency space heating gas-fired immace greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency space heating gas-fired immace greater than or equal to 95% and the an electronically commutated motor (ECM) for the fain, baseline is an 85% AFUE finames without an ECM motor. Savings is due to the increase in efficiency associated with he 95% AFUE finames without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE finames without an ECM motor. Savings is due to the increase in efficiency gase the efficiency gase mechanisms were therefore the efficiency case is a stand-duoine gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-duoine gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-duoine gas stonge water heater with a unified denergy factor >= 0
		The high efficiency case is a boiler with an APUE greater than or equal to 90% while the baseline has an APUE of 85%. The savings is due to an necrose in efficiency case is a boiler with an APUE greater than or equal to 90% while the baseline has an APUE of 85%. The savings is due to an necrose in efficiency case is a combo-boiler with an APUE greater than or equal to 90% while the baseline has an APUE of 85%. The savings is due to an necrose in efficiency case is a combo-boiler with an APUE greater than or equal to 90% while the baseline has an APUE of 85%. The savings is due to an necrose in efficiency case is a combo-boiler with an APUE greater than or equal to 95% while the baseline has an APUE of 85%. The savings is due to an necrose in efficiency case is a combo-boiler with an APUE greater than or equal to 95% while the baseline has an APUE of 85%. The savings is due to an necrose in efficiency space heating gas-fired imnace greater than or equal to 95% APUE with an electronically commutanted motor (ECM) for the fan. baseline is an 85% APUE finmace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% APUE finmace. Measure is a high efficiency space heating gas-fired imnace greater than or equal to 97% APUE with an electronically commutanted motor (ECM) for the fan. baseline is an 85% APUE finmace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% APUE finmace. Place of the phase mechanical warm more ost effective by reclaiming energy from echants artiflows. An efective possibly results due to the increase in efficiency case is a stand-dione gas stonge water beater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-dione gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-dione gas stonge water heater with a unified energy factor >= 0.64. The baseline is a feder
		The High efficiency case is a boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an recrease in efficiency case is a combo-boiler with an AFUE greater than or equal to 90% while the baseline has an AFUE of 85%. The savings is due to an recrease in efficiency case is a combo-boiler with an AFUE greater than or equal to 90% while the baseline has an AFUE of 85%. The savings is due to an necrease in efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an necrease in efficiency space heating gas-fired funnee greater than or equal to 95% AFUE with an electronically commutated motor (ECM) for the fan. baseline is an 85% AFUE funnee, without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE funnee. Measure is a high efficiency space heating gas-fired funnee greater than or equal to 97% AFUE with an electronically commutated motor (ECM) for the fan. baseline is an 85% AFUE funnee, without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE funnee. Measure is a high efficiency gase feature funnor savings in the passeline is an 85% AFUE funnee. Measure is a high efficiency gase feature funner savings in the passeline is an 85% AFUE funnee. Death Recovery Ventilation (HRV) can help make mechanical weathing and effective by reclaiming energy from echanical anti-rowery. The high efficiency case is a stand-alone gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-alone gas stong-electron with the unified energy factor >= 0.68. The baseline is a federal code gas water heater. The high efficiency case is a stand-alone gas some electron with a unified energy factor >= 0.68. The baseline is a federal code gas water heater.
		The Bigg of fictioncy case is a combo-boiler with an AFUE greater than or equal to 90% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an increase in efficiency condensing water heater replacing a federal code gas water heater. Savings is due to the higher efficiency associated with Assaure is a high efficiency space heating gas-fired furnace greater than or equal to 95% AFUE with an electronically commutated motor (ECM) for the fain. baseline is an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace. The baseline is an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace entall transcentation and the part of the problem of the Real Recovery verifications (HRV) can help make mechanical wentling may encept from exhaust an inflows. An electric penalty results due to the increased electricity consumed by the system fans. The baseline efficiency case is a stand-alone gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-alone gas stonge water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater.
		The high efficiency case is a combo-boiler with an AFUE greater than or equal to 95% while the baseline has an AFUE of 85%. The savings is due to an necrose in efficiency condensing water heater replacing a federal code gas water heater. Savings is due to the higher efficiency associated with condensing water heaters. Measure is a high efficiency space heating gas-fred furnace greater than or equal to 95% AFUE with an electronically commutated motor (ECM) for the fan. baseline is an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace. Measure is a high efficiency space heating gas-fred furnace greater than or equal to 97% AFUE with an electronically commutated motor (ECM) for the fan. Baseline is an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace effects receive its an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace effects receively result in the 95% AFUE furnace. Pages Received and the 95% AFUE furnace effects receively results are proported as a stand-dolone gas storage water beater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. By the efficiency case is a stand-dolone gas storage water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater. By the efficiency case is a stand-dolone gas storage water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater.
<u> </u>		Measure is a high efficiency condensing water heater replacing a federal code gas water heater. Savings is due to the higher efficiency associated with condensing water heaters. Measure is a high efficiency space heating gas-fired fumace greater than or equal to 95% AFUE with an electronically commutated motor (ECM) for the fan. baseline is an 85% AFUE fumace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE fumace. Measure is a high efficiency space heating gas-fired fumace greater than or equal to 97% AFUE with an electronically commutated motor (ECM) for the fan. baseline is an 85% AFUE fumace without an ECM motor. Savings is due to the increase in efficiency associated with the 97% AFUE fumace. First Recovery Verminons (HRV) can frep make mechanical weathrant more cost effective by reclammag energy from echanical arriflows. An electric possibly results due to the increase of electricity consumed by the system fins. The baseline efficiency case is a stand-done gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-done gas stonge water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater. The high efficiency case is a stand-done gas stonge water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater.
		Measure is a high efficiency space heating gas-fired furnace greater than or equal to 95% AFUE with an electronically commutated motor (ECM) for the fain, baseline is an 85% AFUE furnace without an ECM motor. Savings is due to the increase in efficiency associated with the 95% AFUE furnace. Measure is a high efficiency space beating gas-fired furnace greater than or equal to 97% AFUE with an electronically commutated motor (ECM) for the fain. Beating is an 85% AFUE furnace, whithou an ECM motor. Savings is due to the increase in efficiency associated with the 97% AFUE furnace, penalty results due to the increased electricity consumed by the system fains. The baseline efficiency case is an ASHRAE 62.2-compliant exhaust fain system with no hart recovery. The high efficiency case is a stand-done gas stonge water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. Savings is due to the increase in efficiency associated with the 0.64 UEF water heater. The high efficiency case is a stand-done gas stonge water heater with a unified denergy factor >= 0.68. The baseline is a federal code gas water heater. The high efficiency case is a stand-done gas stonge water heater with a unified denergy factor >= 0.68. The baseline is a federal code gas water heater.
		Measure is a high efficiency space heating gas-fired furnace greater than or equal to 97% AFUE with an electronically commutated motor (ECM) for the fan, baseline is an 85% AFUE furnace, whithou an ECM motor. Starding is due to the increase, in efficiency associated with the 97% AFUE furnace and are Recovery. The high efficiency case is a stand-alone gas stonge water heater with a unified energy factor > 0.64. The baseline is a federal code gas water heater. Starding is due to the increase of efficiency case is an area of the stand-alone gas stonge water heater with a unified energy factor > 0.64. The baseline is a federal code gas water heater. The high efficiency case is a stand-alone gas stonger with the 0.64 UEF water heater. The high efficiency case is a stand-alone gas stonge water heater with a unified denergy factor >= 0.68. The baseline is a federal code gas water heater. The high efficiency case is a stand-alone gas stonge water heater with a unified denergy factor >= 0.68. The baseline is a federal code gas water heater.
		Heat Keoveyt Ventilations (HKV) can help make mechanical ventilation more cost effective by reclaiming energy from echanical arrivoss. An electric penalty results due to the increased electricity consumed by the system fins. The baseline efficiency case is an ASHRAE 62.2-compliant exhaust fan system with no heart recovery. The high efficiency case is a stand-alone gas storage water heater with a unified energy factor >= 0.64. The baseline is a federal code gas water heater. Savings is due to the increase in efficiency associated with the 0.64 UEF water heater. The high efficiency case is a stand-alone gas storage water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater.
		The high efficiency case is a stand-alone gas stonge water heater with a unified energy factor ≈ 0.64. The baseline is a federal code gas water heater. Savings is due to the increase in efficiency associated with the 0.64 UEF water heater. The high efficiency case is a stand-alone gas stonge water heater with a millied energy factor ≈ 0.68. The baseline is a federal code gas water heater.
		The high efficiency case is a stand-alone gas storage water heater with a unified energy factor >= 0.68. The baseline is a federal code gas water heater.
		Savings is due to the increase in efficiency associated with the 0.68 UEF water heater.
		The high efficiency case is a gas tankless water heater with a unified energy factor >= 0.87. The baseline is a federal code gas water heater. Savings is due to the increase in efficiency associated with the 0.87 UEF tankless water heater.
TOW LIOW SHOWER		The high efficiency measures is a low-flow showerhead with a flowrate of 1.75 GPD or less. Savings is due to the lower flow rate when compared to a federal standand showerhead.
TSV	3 1	The high clineacy measures is a thermostatic shuldt valve that automaterally shale of the water when the temperature of shower becomes warm before a person is taking a shower. The baseline is a federal code showerhead., Savings is realized due to the reduction in hot water usage associated with a person waiting for the shower temperature to heat up.
TSV Showerhead		The light efficiency metaters is a thermostate should valve combined with a low flow showerhead. Inc baseline is a technic code showerhead, Savings is exemised also to containation of a reduction in hot water usage associated with a person waiting for the shower temp to hear up and the lower flowrate associated with the low flow showerhead.
Wifi Thermostat - Cooling And Heating		Installation of a WF-Fi programmable thermostat which gives the ability to adjust heating and air-conditioning operating times according to a pre-set exhedite and can be adjusted remotely. The baseline is a measure mix of programable thermostats and manual thermostats. Savings occur due to the combination of being able to set your thermostat and also being able to adjust your thermostat while not at home.
Wifi Thermostat - Gas Heat Only		Installation of a Wi-Fi programmable thermostat which gives the ability to adjust heating operating times according to a pre-set schedule and can be adjusted remotely. The baseline is a measure mix of programable thermostats and manual thermostats. Savings occur due to the combination of being able to set your thermostat and also being able to adjust your thermostat while not at home.
Programmable Thermostat		installmon of a programmable thermostat which gives the ability to adjust heating or ar-conditioning operating times according to a pre-set schedule. The baseline is a manual thermostat. Savings occur due to the ability to pre-set your schedule eliminating the need to manually adjust when either going to bed or leaving your house.
Combo Furnace		This measure promotes the installation of a combined conclusing high-efficiency furnace and water fauting unit. Combined tunnace and water beating systems are more efficient than separate systems because they eliminate the standby heat losses of an additional tank. Savings occur both due to the racreased efficiency of the funnace and the elimination of the toneget annix birth would have standby losses.
Water Heater, Indirect, Gas		Installation of high efficiency gas water heaters. Indirect water heaters use storage tank that is heated by the main boiler. The energy stored by the water tank allows the boiler to turn off and on less often, saving energy.
Program Planning & Administration Marketing		This is not a measure but is the Program Planning & Administration budget listed for the program in table G-2. This is not a measure but is the Marketine budget listed for the noneram in table G-2.
Sales, Technical Assistance & ' Evaluation & Market Research	Fraining	This is not a measure but is the Sales, Technical Assistance & Traning budget listed for the program in table G-2. This is not a measure but is the Evaluation & Marker Research budget listed for the program in table G-2.

		Gas Programs
Program	Measure	Measure Description
	Aerator	The installation of a low flow faucet aerator. Savings are acheived by replacing an existing high flow rate faucet aerator with a low flow faucet aerator.
	Weatherization	The installation of weatherization measures in electric heated homes. Savings are acheived by applying insulation upgrades or air sealing to minimize inflication of outside air through cracks and leaks in the existing home shell.
	Air Sealing Kit (Gas)	The installation of recessed lighting cans that provide air sealing benefits. Savings are achieved by replacing leaky recessed lighting cans in the participating household
	Showerhead	The installation of a low flow showerhead with a control that limits flow once the water is heated. Savings are based on electric heating.
	Pipe Wrap	The installation of domestic hot water pipe wrap to reduce electric water heating. Savings are achieved by applying insulation in existing equipment without pipe insulation.
EnergyWise	Thermostat	Installation of a programmable thermostat, which gives the ability to adjust gas heating or air-conditioning operating times according to a preset schedule.
		The installation of Wi-Fi themostat with the abitity to adjust gas heating or air-conditioning operating times according to a pre-set schedule to meet occupancy needs and also be able to remotely adjust schedules when not at home. Baseline is a blend of manual thermostars and programable
	WiFi Thermostat	thermostats.
	Participants	This measure tracks program participation and does not have an associated energy savings value.
	Program Planning & Administration	This is not a measure but is the Program Planning & Administration budget listed for the program in table G-2.
	Marketing	This is not a measure but is the Marketing budged listed for the program in table G-2.
	Sales, Technical Assistance & Training	This is not a measure but is the Sales, Technical Assistance & Traning budget listed for the program in table G-2.
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table G-2. Thermal shell air leaks are sealed through strategic use and location of aircticht materials. The baseline efficiency case is the existing building before the
	Air Sealing	arisental area in tomos accounted manager are an reasonably in existing air changes per hour (ACHPRE)
	ouet non lat	Vendors who install a variety of non-lighting gas measures at multifamily facilities within common areas and dwelling units. Gas measures include HVAC inculation and domastic hat notice amintment and measures.
	cust non-igt	TY AC, insuator, and ourselve toward equipment and resolves. TY AC, insuator, and ourselve toward equipment and resolves. TO AC, insuator, and ourselve toward equipment and resolves. TO AC, insuator, and ourselve toward experience to the condition of the condition of the conditions have eighted by restriction of the condition of the conditio
	Demand Circulator	water line. After water reaches a desired temperature, the controls will automatically turn off the pump. The baseline efficiency case is a hot water system without downed of control on control of the pump.
	Pontana Cheurator	District was sealed by account of second disconnected duct foints and sealing gas or esame with mastic and fiber mesh tane as any contrain. Outsigners are sealed by measurement duct foints and sealing gas or esame with mastic and fiber mesh tane as any contraints. The baseling
	Duct Sealing	Does are searce by reconnecting unconnected uner Johns and searing gaps of searing with this way and incertured tapped are, the obscure efficiency case is the existing facility or equipment prior to the implementation of duct sealing.
	Fancet Aerator	The installation of a low flow faucet aerator. Savings are acheived by replacing an existing high flow rate faucet aerator with a low flow faucet aerator.
	Inculation	This relates to insulation upgrades which are applied in existing multifamity facilities. The baseline efficiency case is characterized by the total R-value of the activities only becomen or eighand.
	Low-Flow Showerhead	or the Casting and a sace-wat. The installation of a low flow showerhead with a control that limits flow once the water is heated. Savines are based on eas heating.
		dunar oid to acan an official remains of the control of a control of the control
	Pipe Wrap (Heating)	The installation of pipe wrap to reduce gas heating. Savings are achieved by applying insulation in existing equipment without pipe insulation. The installation of demonstricted under rates to reduce one under benefits a Savings are appeared by managing invalidation in verting a managing trailing and the continue of
EnergyWise	Pipe Wrap (Water Heating)	тие изманитов об полеме посматер пре мар то темпее gas water reating, эленду are acuteved by applying insuration in existing equipment without pipe insulation.
Multifamily		Installation of a programmable thermostat which gives the ability to adjust heating or au-conditioning operating times according to a pre-set schedule. For the installation of a movemmable thermostar the baseline efficiency case is an HVAC extern usine natural oss to movide state heating without a
	Programmable Thermostat	to me insunancia of a pogaminiore metrosad, use custing cine circuity case is an iteme of second using manage a programmable thermostat.
		The high efficiency measures is a thermostatic shutoff valve that automatically shuts off the water when the temperature of shower becomes warm before a nerson is taking a shower. The baseline is a federal code showerhead. Sovings is realized due to the reduction in hot water usage associated with a
	Thermostatic Shut-off Valve	person waiting for the shower temperature to heat up.
		The high efficiency measures is a thermostatic shutoif valve combined with a low flow showerhead. The baseline is a federal code showerhead. Savings is realized due to the combination of a reduction in hot water usage associated with a person waiting for the shower temp to heat up and the lower flowrate
	TSV Showerhead	associated with the low flow showerhead.
	WiFi thermostat gas	Installation of a Wi-th programmote themostat Ware gives the abuilty to adjust nearing operating times according to a pre-set scriectule and can be adjusted remotely. The baseline is a measure mix of morganable thermostats and manual thermostats. Savings occur due to the combination of being able to set your thermostat and also being able to adjust your themostat while not all home.
	Participants	This measure tracks program participation and does not have an associated energy savings value.
	Program Planning & Administration	This is not a measure but is the Program Planning & Administration budget listed for the program in table G-2.
	Marketing	This is not a measure but is the Marketing budget listed for the program in table G-2.
	raining	This is not a measure but is the Sales, Technical Assistance & Traning budget listed for the program in table G-2.
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table G-2.

		Gas Programs
Program	Measure	Measure Description
	New movers dual fuel New movers gas only	A Home Energy Report sent to recently activated electric and gas customers that displays home energy consumption in comparison with peers and prompts energy conserving behavior. The baseline is a control group of homes that does not receive Home Energy Reports. This group no longer receives home energy report. No savings are being claimed for this group.
Home Energy Reports	Opt-out dual fuel Opt-out gas only	A Home Energy Report sent to electric and gas customers that displays home energy consumption in comparison with peers and prompts energy conserving behavior. The baseline is a control group of homes that does not receive Home Energy Reports. A Home Energy Report sent to electric and gas customers that displays home energy consumption in comparison with peers and prompts energy consumption in comparison with peers and prompts energy consumption in comparison with peers and prompts energy management of the passeline is a control group of homes that does not receive Home Energy Reports.
'	Refill Program Planning & Administration	This category is no longer used. This is not a measure but is the Procram Planning & Administration budget listed for the procram in table G-2.
	Marketing	This is not a measure but is the Marketing budget listed for the program in table G-2.
	Sales, Technical Assistance & Training Evaluation & Market Research	This is not a measure but is the Sales, Technical Assistance & Traning budget listed for the program in table G-2. This is not a measure but is the Evaluation & Market Research budget listed for the program in table G-2.
	CODES AND STANDARDS	Energy efficiency code trainings and advocacy work to improve energy efficiency of buildings and equipment within Rhode Island. Savings are claimed by increasing the percentage of code compliant residential homes.
	CP	Heating styring resulting from Energy/Star Hornes Code Plus projects with high efficient beating equipment, insulation, and infiltration. Code Plus projects are positioned below Tier I Energy Start Homes and above current URDH. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	CP-DHW	DHW savings resulting from Laregy Star Homes Code Plus projects with high efficient water heating equipment. Code Plus projects are positioned below Plus Train Energy Start Homes and above current URDH. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR CP	Heating straing resulting from Renovation Relab Code Plus projects with replacement high effected heating equipment, insulation, and infiltration. Renovation Rehab Code Plus projects are postioned below Tier 1 Energy Start Homes and above current URDH. This measure saves energy by increasing the differency when compared to the base case of the URBH.
	RR CP-DHW	DHW starings resulting from Energy Start Homes Code Plus projects with replacement lugic efficient water healing equipment. Code Plus projects are positioned below Tier I Energy Start Homes and above carrent URDH. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR Tier 1	Heating savings resulting from Renovation Relub projects with replacement high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR Tier 1 - DHW	DHW savings resulting from Renovation Rehab projects with replacement high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR Tier 2	Heating savings resulting from Renovation Rehab projects with replacement high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR Tier 2 - DHW	DHW savings resulting from Renovation Rehab projects with replacement high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR Tier 3	Heating savings resulting from Renovation Rehab projects with replacement high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	RR Tier 3 - DHW	DHW savings resulting from Renovation Rehab projects with replacement high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
Residential New	RR Tier 4	Heating savings resulting from Renovation Rehab projects with replacement high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
Construciton	RR Tier 4 - DHW	DHW savings resulting from Renovation Rehab projects with replacement high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	SHOWERHEAD	The installation of a low flow showerhead with a control that limits flow once the water is heated.
	Tier 1	reamig saving, reducing non rategy star routes projects with ingir effecting equipment, insulation, and minitation, i insulation starts energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 1 - DHW	DHW savings resulting from Energy Star Homes projects with high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 2	Heating savings resulting from Energy Star Homes projects with high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 2 - DHW	DHW savings resulting from Energy Star Homes projects with high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 3	Heating savings resulting from Energy Star Homes projects with high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 3 - DHW	DHW savings resulting from Energy Star Homes projects with high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 4	Heating savings resulting from Energy Star Hones projects with high efficient heating equipment, insulation, and infiltration. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Tier 4 - DHW	DHW savings resulting from Energy Star Homes projects with high efficient water heating equipment. This measure saves energy by increasing the efficiency when compared to the base case of the UDRH.
	Adaptive Reuse	Gas savings resulting from converting abandoned mills and factory buildings into multifamily residences. Adaptive Reuse projects include a custom mix of measures and improvements.
	Participants	This measure tracks program participation and does not have an associated energy savings value.
	Program Planning & Administration	This is not a measure but is the Program Planning & Administration budget listed for the program in table G-2. This is not a measure but is the Marketine budget listed for the newcream in table G-3.
	Sales, Technical Assistance & Training	Sales, Technical Assistance & Training This is not a measure but is the Sales, Technical Assistance & Training United Sales, Technical Assistance Research
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table G-2.

		Cae Pratriams
Program	Measure	Cas i rigi alis
110gram	Measure	Measure Description
	Heating System Replacement	The insullation of high efficiency heating . Savings are acheived by replacing an existing inefficient heating system with a high efficient one. The insullation of worther participances in electric beared homes. Savines are acheived by anolysine insulation menucles or air esoline in minimze
Single Family -	Weatherization	the manner of warmen measures in event beared noises, but may be a specific manner of performs of a seaming of minimum inflitration of outside air through cracks and leaks in the existing home shell.
Income Eligible		This measure tracks program participation and does not have an associated energy savings value.
Services	Program Planning & Administration	This is not a measure but is the Program Planning & Administration budget listed for the program in table G-2. This is not a measure but is the Madeatime hadane listed for the management in table G-2.
	Sales, Technical Assistance & Training	This is not a measure but is the Sales, Technical Assistance & Training budget listed for the program in table G-2.
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table G-2.
	Air Sealing	Thermal shell air feaks are seated through strategic use and location of air-tight materials. The baseline efficiency case is the existing building before the air sealing measure is implemented. The baseline building is characterized by the existing air changes per hour (ACHPRE)
		The installation of a high efficiency natural gas fried condensing hot water boiler. High-efficiency condensing boilers can take advantage of improved design, sealed combustion and condensing flue cases in a second heat exchanger to achieve improved efficiency. The baseline efficiency is determined
	Boiler Commercial	based on the type of exhisting heating equipment installed.
	Boiler	The installation of high efficiency boiler to replace the existing inefficient furnace, hydronic boiler or steam boiler. The baseline efficiency is determined based on the type of exhisting heating equipment installed.
	Cust Non-1 of	Vendors install a variety of non-lighting gas measures at multifamily facilities within common areas and dwelling units. Gas measures include HVAC, insulation and domestic but uster continuent and measures.
	Cust iven Ege	Demand circulators save energy by recreating cooled water that's been sitting in the hot water line, sending it back to the water heater through the cold
	Demand Circulator	water line. After water reaches a desired temperature, the controls will automatically turn off the pump. The baseline efficiency case is a hot water system without demand circulator controls.
	Duct Sealing	Ducts are scaled by reconnecting disconnected duct joints and scaling gaps or seams with mastic and fiber-mesh tape as appropriate. The baseline efficiency case is the existing facility or equipment prior to the implementation of duct scaling.
	Format A arator	Tha installation of a low flow from sometor. Surione on a calculus har real point in the flow from from flow from sometor.
	F	THE HEAD OF THE STATE OF THE ST
	Furnace	instantation of the interesty that are equipment to replace existing interest turnaced by the water tank allows the hotier to turn off and on less
	Indirect	often, saving considerable energy. The baseline efficiency case is the existing inefficient water heater.
	Insulation	This relates to insulation upgrades which are applied in existing multifamily facilities. The baseline efficiency case is characterized by the total R-value of the existing artic, basement or sidewall.
	Low-Flow Showerhead	The installation of a low flow showerhead with a control that limits flow once the water is heated. Savings are based on gas heating.
Income Elizible	On Demand Water Heater	On Demand water heaters circulate water through a heat exchanger to be heated for immediate use, eliminating the standby heat loss associated with a storage tank. The baseline efficiency case is a standalone tank water heater below a defined UEF level.
Multifamily	Dies Wess (Hooding)	The interest of an extension of bostons of continued by conditions is an interest or inclinual actions and the continued and the conditions of the continued and the conditions of the continued and the continued
	ripe wrap (neaung)	The installation of demostic between the water of the wat
	Pipe Wrap (Water Heating)	the mannator of concerne for which pipe with 10 reduce gas which remains strongs are defined by applying mannator in casating equipment without pipe insulation.
	Ē	installation of a programmable thermostat which gives the ability to adjust beating or arcconditioning operating times according to a pre-set schedule. For the installation of a programmable thermostat, the baseline efficiency case is an HVAC system using natural gas to provide space heating without a
	Programmable Thermostat	Tongen milet the most at the water through a heat exchanger to be heated for immediate use aliminating the standby heat loss associated with a
	Tank Water Heater	storage tank. The baseline efficiency case is a standalone tank water below a defined UEF kevel.
	Thermostatic Shut-Off Valve	The high efficiency frestures is a thermostate shufort valve that automate any source of the more than the emperature of shower becomes warm before a person is taking a shower. The baseline is a federal code showerhead, Savings is realized due to the reduction in hot water usage associated with a research waiting for the shower temperature to heat up.
		the high efficiency measures is a thermostatic shutoff valve combined with a low flow showerhead. The baseline is a federal code showerhead. Savings is
	TSV Showerhead	realized due to the combination of a reduction in hot water usage associated with a person waiting for the shower temp to heat up and the lower flowrate associated with the low flow showerhead.
	WiF Thermostat Gas	Installation of a Wi-Fi programmable thermostat which gives the ability to adjust heating operating times according to a pre-set schedule and can be be abilisted remotely. The baseline is a measure mix of programable thermostats and manual thermostats. Savings occur due to the combination of being able to set your thermostat and also being able to adjust your thermostat while not all home.
	Participants	This measure tracks program participation and does not have an associated energy savings value.
	Program Planning & Administration Marketing	This is not a measure but is the Program Planning & Administration budget listed for the program in table G-2. This is not a measure but is the Marketine butloet listed for the mooram in table G-3.
	Sales, Technical Assistance & Training	This is not a measure but is the Sales, Technical Assistance & Training budget listed for the program in table G-2.
	Evaluation & Market Research	This is not a measure but is the Evaluation & Market Research budget listed for the program in table G-2.

PUC 1-18

Request:

Please update the response to Record Request 4 in Docket No. 4888 for the current proposal. For the table that was provided in that response, please reproduce the table with the following amendments:

- Column C will be "Power Sector Transformation 2020 Values
- Column D will be "2018-2020 3YP Plus 2019 Values"
- Column E will be "2019 Annual Plan Values"
- Column F will be "2019 Annual Plan Year-to-Date Actual"
- Column G will be "2020 Annual Plan Values"
- New rows should be added for non-residential customers

Response:

Below please find RIPUC Docket No. 4888 In Re: 2019 Energy Efficiency Plan Responses to Record Requests Issued at the Commission's Evidentiary Hearing On December 11, 2018 (http://www.ripuc.org/eventsactions/docket/4888-NGrid-RRs(12-18-18).pdf), with updated numbers from the current 2020 Plan and with five amended columns per the request stated above and a row added for small business.

Record Request No. 4 in Docket No. 4888:

- a) What was proposed in the Three-Year Plan for heat pumps?
- b) What would be the proposal if the 2020 EE Plan included only the Three-Year Plan proposal and the proposal included in the original settlement agreement PST docket concerning heat pumps?
- c) What is the current 2020 EE Plan proposal? Please note what units the Company is using to indicate the number of units in each proposal.

Updated Response to Record Request No. 4 for 2020 Plan

Following the written response is a table that represents the numbers outlined below. The numbers below refer to the cell(s) in the table)

- a) The total number of single-family homes and multi-family housing units included in 2020 within the Rhode Island 2018 2020 Energy Efficiency Plan: **109** (Cell A13)
 - i. Market Rate Single Family (SF) Homes: **65** (Sum: Cell A1+Cell A2+Cell A3)
 - 1. Market rate SF oil fuel switching: 20 (A1)
 - 2. Market rate SF oil fuel switching replace on failure: 10 (A2)
 - 3. Market rate SF electric resistance fuel switching: 35 (A3)

PUC 1-18, page 2

- ii. Income Eligible Single Family Homes: 0 (Sum: A4+A5+A6)
- iii. Multifamily Housing Units: 44 (Sum: A7+A8+A9+A10+A11+A12)
- iv. Small Business Unit: 0 (Sum: A14+A15+A16)

b)

- i. Only the Three-Year Plan proposal: **109** single family homes and multifamily housings units. (A13)
- ii. Three Year Plan Proposal PLUS the original settlement agreement Power Sector Transformation docket for heat pumps: **196** single family homes (A13+C13)
- c) The total number of single family homes and multifamily units for 2020: **408** (G13)
 - I. Market Rate Single Family (SF) Homes: **193** (G1+G2+G3)
 - 1.Market rate SF oil fuel switching: 155 (G1)
 - 2.Market rate SF oil fuel switching replace on failure: 0 (G2)
 - 3.Market rate SF electric resistance fuel switching: 38 (G3)
 - II. Income Eligible Single Family (SF) Homes: **40** (G4+G5+G6)
 - 1.Income eligible SF oil fuel switching: 20 (G4)
 - 2.Income eligible SF oil fuel switching replace on failure: 0 (G5)
 - 3.Income eligible SF electric resistance fuel switching: 20 (G6)
 - III. iii. Multifamily (MF) Income Eligible Housing Units: **125** (G7+G8+G9)
 - 4.MF income eligible oil fuel switching: 0 (G7)
 - 5.MF income eligible oil fuel switching replace on failure: 0 (G8)
 - 6.MF income eligible electric resistance fuel switching: 125 (G9)
 - IV. iii. Multifamily (MF) Market Rate Housing Units: **50** (G10+G11+G12)
 - 7.MF income eligible oil fuel switching: 0 (G10)
 - 8.MF income eligible oil fuel switching replace on failure: 0 (G11)
 - 9.MF income eligible electric resistance fuel switching: 50 (G12)
- d) The total number of small business units for 2020: **30** (G14+G15+G16)
 - 4.Small business oil fuel switching: 20 (G14)
 - 5.Small business oil fuel switching replace on failure: 0 (G15)
 - 6.Small business electric resistance fuel switching: 10 (G16)

^{* 2019} Values represents the number of homes/housing units that will receive air source heat pumps as primary heat source. Housing units included for MF Income Eligible Heat Pumps in the above table are estimated based off planned budget allocation.

PUC 1-19

Request:

Please provide a table of all measures eligible for the proposed Delivered Fuels Performance Incentive Mechanism. Separate rows of the table by program sectors. Columns should include the following:

- The number of installations proposed in the plan
- The proposed cost of these installations
- The proposed budget of these installations
- The percentage of incentive to the participant (i.e., 100*participant incentive/measure cost) per unit
- If the same measure is also offered for non-delivered fuels, the percentage of the incentive to a non-delivered fuels participant per unit
- The expected incremental electrical energy saved or used in kWh per unit
- The expected incremental non-electrical energy saved or used per unit
- The net incremental energy saved in MMBtu per unit

Response:

Please see Attachment PUC 1-19.

41 51

PUC 1-20

Request:

Please provide a table of measures that are aimed at reducing gas or electric heating energy or demand, but that are available to gas, electric, or oil heat customers. Separate rows of the table by program sectors. Columns should include the following:

- The columns listed in 1-19
- For each of the columns above, the fraction of each that is expected to represent measure taken by oil heat customers (e.g., the percentage of installations expected to be installed at oil heat homes).

Response:

Please see Attachment PUC 1-20.

Attachment PUC 1-20 presents the measures that are offered in the Residential programs that are aimed at reducing gas or electric heating energy or demand. These measures can be categorized as the following:

- Heating system replacement including heating equipment, pumps, controls, sizing optimization, installation quality assurance/quality control, maintenance
- Hot water heating system replacement
- Hot water conservation
- Pipe insulation
- Weatherization
- Air sealing
- Thermostats

While these measures are available to gas, electric, or oil heat customers, they will only reduce gas or electric heating energy or demand for customers with gas or electric heating and/or hot water heating, not for customers with oil heat and/or hot water. For example, a customer who originally has oil heat and/or hot water heating and converts to a high efficiency gas or electric heat or hot water system will increase gas or electric heating energy use or demand as they are adding new gas or electric consumption they didn't have before. Therefore, the fraction of each measure that is expected to represent quantities of oil heat customers ("column i" in Attachment PUC 1-20) will be zero.

Source 2020 Electric Portfolio Benefit Cost Model

PUC 1-21

Request:

Please explain if there are electric savings associated with weatherization of delivered-fuel homes. If so, please explain if these savings have typically counted towards National Grid's achievement of kWh and kW savings targets and actual performance in previous plans. Please also explain if these savings are counted in the proposed savings Core Electric targets and would be eligible to count toward actual Core Electric performance in the proposed Plan.

Response:

There are electric savings associated with weatherization of delivered fuel homes. In plans prior to the 2020 Energy Efficiency Program Plan (EEPP), the kWh and kW savings from delivered fuel weatherization were included in the overall program kWh and kW savings targets and actual performance. In the 2020 EEPP, the kWh savings associated with delivered fuel homes has been removed from the Core Electric performance targets. The kWh associated with delivered fuel homes has been converted into MMBTU and included in the Delivered Fuels Performance Incentive Mechanism. The kW savings associated with weatherization of delivered fuel homes continue to be included in the demand component of the Core Electric Performance Incentive Mechanism.

PUC 1-22

Request:

For all efficiency plans filed since 2008, please provide a table with the following gas, electric, and delivered fuels weatherization by year:

- The number proposed
- The number achieved
- The percentage of incentive to the participant (i.e., 100*participant incentive/measure cost) per unit

Response:

Please see Attachment PUC 1-22 for the requested information.

Note

Programs with discreet weatherization participation are shown above.

EnergyWise did not plan with weatherization participation values until 2012. Planning was accomplished by savings value.

Participation values include all participation for the program year and inclusive of customers that may have participated more than once in the same year.

Income Eligible Services (IES) is at no cost to the customer, therefore the incentive level is 100%

% of incentive = Incentive amount/Total Project Cost

Plan = proposed # of participants in the plan

Actual = Achieved # of participants

Weathization articipation values are informational and not specific program metric.

PUC 1-23

Request:

Page 12 of Attachment 1 of the 2019 Energy Efficiency Program Plan (2019 Plan) filed in Docket No. 4888 says the following:

"Another area of stakeholder interest has been in the area of deliverable fuels. Customers that heat their homes with deliverable fuels have participated in the no-cost home energy assessment portion of the program but have continued to undergo weatherization installations at a lower rate than customers that heat with electricity or natural gas. The program has increased incentive levels for deliverable fuel customers to the same level as other heating fuels since Q3 of 2018 and is planning to continue these levels through 2019."

Please explain by what administrative process, if any, National Grid increased the incentive levels for these customers during the 2018 Program Year.

Response:

National Grid, upon approval of the Energy Efficiency Program Plan (EEPP), is responsible for implementing, delivering, and reporting the planned and actual savings and spending for the programs and sectors in the EEPP. During the course of the year, incentives for programs and measures are continually assessed and, if necessary, adjusted to manage both savings goals and budget.

In 2018, providing parity to deliverable fuels customers was discussed as it had been for the past few years and was identified as a priority for several stakeholders in the Technical Working Group. In preparation for the 2019 program year, the delivered fuel incentive in 2018 was increased to gauge customer response and prepare for the following program year. The change in the incentive level was discussed with stakeholders at the Technical Working Group and during Residential Sector Team meetings with EERMC consultants and OER. While this incentive change was discussed with stakeholders, incentives are subject to change as needed to support program goals and targets.

PUC 1-24

Request:

Will customers be required to have an on-site home energy assessment to receive incentives for high efficiency heating equipment? Are customers required to have an on-site home energy assessment to receive incentives for other products, including heat pump hot water heaters?

Response:

On-site Home Energy assessments are required for customers who participate in the HVAC Electric Air Source Heat Pump (ASHP) measure for displacement/replacement of oil, propane or electric heating systems. This program design was intended to create an optimal thermal envelope to complement the new delivery of heat through ASHPs, and to maximize the likelihood of a positive customer experience associated with the installation and operation of an ASHP.

An on-site Home Energy assessment is not a requirement to receive incentives for other forms of high efficiency heating equipment.

An on-site Home Energy assessment is not a requirement to receive incentives for high efficiency water heating equipment.

PUC 1-25

Request:

Note 21 on Bates page 102 of the filing describes that there is an expected increase in heating energy use that partially offsets an expected decrease in lighting energy use when a participant replaces an incandescent light with an LED light.

- a. Please confirm that this net energy use is captured in the Technical Reference Manual and is embedded in the benefits cost analysis of the measure, program, and plan.
- b. Please explain whether this expected increased use of energy for heating has previously been included in setting National Grid's electric or natural gas savings targets, and/or if it was accounted for in actual electric or natural gas performance in any previous year. For example, is National Grid's actual gas savings performance inclusive of increased gas use due to installation of LEDs in gas-heating homes?
- c. Please explain whether this expected increased use of energy for heating is included in setting National Grid's electric (Core or Delivered Fuels) or natural gas savings targets, and/or if it will be accounted for in actual electric or natural gas performance in the 2020 Plan and Program Year.

Response:

a) Treatment of increased heating energy requirements due to installations of efficient lighting varies by program. The table below indicates how each program that includes lighting measures treats potential increase in heating load in both the Technical Reference Manual (TRM) and Benefit Cost (B/C) Analysis (BCA) models for the proposed 2020 Energy Efficiency programs:

Sector	Program	Captured in TRM	Treatment of Increased Heating Due to Lighting
Commercial and Industrial	All Measures Except Custom	Yes	Captured as negative electric, gas, oil, propane savings/benefit in electric B/C model
Commercial and Industrial	Custom - Systems Approach	Yes - Indicated to be custom calculation	Calculated on a project-by-project basis, so value is not defined in TRM; planned value captured as negative electric, gas, oil, propane savings/benefit in electric B/C model

PUC 1-25, page 2

Sector	Program	Captured in TRM	Treatment of Increased Heating Due to Lighting
			TRM: Calculated on a project-by-project basis, so value is not defined in TRM.
Commercial and Industrial	Custom - Whole Buildings Approach	Yes - Indicated to be custom calculation	BCA: An interactive model of building energy use is developed to determine savings from all measures implemented in buildings participating in the Whole Buildings Approach. Total electric savings count toward electric targets, total gas savings count toward gas targets, and total benefits (inclusive of delivered fuel penalties) are distributed between the electric and gas portfolios for BCA calculations.
Residential	EnergyStar Lighting	Yes	Captured as negative electric, gas, oil, propane savings/benefit in electric B/C model
Residential	EnergyWise Single Family	No	The increased heating value is not defined in the TRM but embedded in energy savings for participants receiving weatherization. The heating savings from weatherization are estimated using a billing analysis that also captures heating impacts due to lighting changes. The planned weatherization savings are factored in to the electric or gas B/C model, based on heating fuel type, to capture this effect.
Residential	Low Income Single Family	No	The increased heating value is not defined in the TRM but embedded in energy savings for participants receiving weatherization/heating system. The heating savings from weatherization/heating system are estimated using a billing analysis that also captures heating impacts due to lighting changes. The planned savings is factored in to the electric or gas B/C model, based on heating fuel type, to capture this effect.

PUC 1-25, page 3

Sector	Program	Captured	Treatment of Increased Heating Due to
Sector	Trogram	in TRM	Lighting
Residential	EnergyWise Multifamily	No	The increased heating value is not defined in the TRM but embedded in energy savings for participants receiving weatherization/heating system. The heating savings from weatherization/heating system are estimated using a billing analysis that also captures heating impacts due to lighting changes. The planned savings is factored in to the electric or gas B/C model, based on heating fuel type, to capture this effect.
Residential	Low Income Multifamily	No	The increased heating value is not defined in the TRM but embedded in energy savings for participants receiving weatherization/heating system. The heating savings from weatherization/heating system are estimated using a billing analysis that also captures heating impacts due to lighting changes. The planned savings is factored in to the electric or gas B/C model, based on heating fuel type, to capture this effect.
Residential	New Construction	No	The REM/Rate model used to model impacts in the New Construction program takes into account increase heating use due to installation of lighting measures). A delta wattage is used to estimate this increased heating usage and factors in heating loads. Negative gas or delivered fuels are not listed separately in the electric benefit-cost model.

- b) The table below indicates how each program treated expected increased use of heating energy due to lighting in 2018 and 2019 program years in setting the Company's savings targets, for which data is most readily available. The approach for these impacts varies from program to program. One of two approaches is used:
 - Some programs use building simulation models or billing analysis to model savings. In these cases, the heating increases associated with lighting contribute to goals and achievement of savings for the program.

PUC 1-25, page 4

• In cases where building simulation models or billing analysis are not used, increased heating is included as a separate stream of negative savings in the benefit-cost model. For electric heat, the increased use counts against electric target setting and performance. Gas and delivered fuel heating impacts do not affect savings targets or tracking towards achievement of those targets. In those cases, the negative savings from increased heating is included as a negative benefit in the electric benefit-cost model, impacting the benefit-cost ratio, but not the savings achievement.

Sector	Program	Treatment of Increased Heating Load from Efficient Lighting in 2018 and 2019
Commercial and Industrial	All Except Custom	Increased use of electric heat is counted against electric goals and performance. Increased gas and delivered fuel heating use is not counted towards electric or natural gas savings goals or performance but is included as a negative electric benefit in cost effectiveness calculations.
Commercial and Industrial	Custom - Systems Approach	Increased use of electric heat is counted against electric goals and performance. Increased gas and delivered fuel heating use is not counted towards electric or natural gas savings goals or performance but is included as a negative electric benefit in cost effectiveness calculations.
Commercial and Industrial	Custom - Whole Buildings Approach	An interactive model of building energy use is developed. Total electric savings count toward electric target setting and performance, total gas savings count toward gas target setting and performance, and total benefits (inclusive of delivered fuel penalties) are distributed between the electric and gas portfolios for both target setting and performance.
Residential	EnergyStar Lighting	Increased gas and delivered fuel heating use is not counted towards electric or natural gas savings goals or performance but is included as a negative electric benefit in cost effectiveness calculations. In 2019, increased use of electric heat is counted against electric goals and performance.
Residential	EnergyWise Single Family	Increased heating use is counted towards natural gas/electric savings goals for participants receiving weatherization since increased heating load from lighting changes are embedded in the savings calculation.

PUC 1-25, page 5

Sector	Program	Treatment of Increased Heating Load from Efficient Lighting in 2018 and 2019
Residential	Low Income Single Family	Increased heating use is counted towards natural gas/electric savings goals for participants receiving weatherization/heating system since increased heating load from lighting changes are embedded in the savings calculation.
Residential	EnergyWise Multifamily	Increased heating use is counted towards natural gas/electric savings goals for participants receiving weatherization/heating system since increased heating load from lighting changes are embedded in the savings calculation.
Residential	Low Income Multifamily	Increased heating use is counted towards natural gas/electric savings goals for participants receiving weatherization/heating system since increased heating load from lighting changes are embedded in the savings calculation.
Residential	New Construction	Actual gas savings performance is inclusive of increased gas use due to installation of LEDs in gas-heated homes. It is embedded in REM/Rate models which are used to calculate heating savings and program goals.

c) For programs where savings from each fuel are separately specified in the benefit-cost model, such as EnergyStar Lighting and C&I (except Custom), heating fuel impacts from gas and delivered fuels only affect the benefit-cost screening and do not contribute to electric savings targets.

For other programs, to the degree that increased heating fuel usage due to lighting are included in the energy savings for a program due to their inclusion in a whole building modeling approach or a billing analysis approach, the increased heating fuel usage due to lighting is accounted for in savings targets and performance targets in the 2020 plan. Savings from the delivered fuel weatherization measures within the EnergyWise Single Family and Low Income Single Family programs contribute to the Delivered Fuel performance incentive mechanism. The savings from these two weatherization measures are derived from billing analysis approaches and are therefore impacted by lighting measures that are also installed by the program.

PUC 1-26

Request:

Regarding delivered fuel customers, please provide the following information:

- a. Do delivered fuel customers have higher electric bills on average than natural gas customers?
- b. On what basis have delivered fuels customers received rebates or incentives for weatherization in the past? Please include the corresponding percentage or dollar amounts of the rebates or incentives.
- c. On what basis have delivered fuels customers received rebates for high efficiency air source heat pumps in the past? Please include the corresponding percentage or dollar amounts of the rebates or incentives.

Response:

a. The Company does not currently directly track which of its customers use delivered fuels. To inform this response, the Company extracted average monthly electric usage data for Rhode Island residential customers that are natural gas heating customers and those that are not.

From this data, it is not possible to definitively say that the residential customers that are not gas heating customers are delivered fuel customers. For example, some of the customers that are not gas heating customers may use electric resistance heating. With the limitations of the available data, the Company can conclude that residential customers that are not gas heating customers had higher average monthly electric usage in 2018 than customers that are natural gas heating customers. A significant confounding factor in this analysis that is not represented in the below table is the potential differences between customers in regions of the state that have access to the gas network and those that do not. For instance, lack of access to the gas network, and thus higher reliance on delivered fuels for heating, is more prevalent in the western portion of Rhode Island. There may be inherent differences in housing stock in this region vs. the more densely populated areas of the state that feature a higher incidence of gas usage for heating. These differences are not incorporated into the analysis below, which simply reports average electric utilization among two generic customer classes. This analysis also does not account for demographic or home characteristics that impact usage across the state.

PUC 1-26, page 2

Table 1. Summary of Average Residential Customer Monthly Energy Use in 2018

Year	Gas Heating Customer	Count of Billed Premises	Average Monthly Electric
	Indicator		Usage (kWh)
2018	Yes	209,903	527
	No	242,990	637

b. While Income Eligible customers have had access to delivered fuel weatherization, market rate customers were first able to access delivered fuel weatherization through an American Recovery and Reinvestment Act (ARRA) grant beginning in 2012. When ARRA ended, delivered fuels were supported through RGGI funds for another year and then transitioned to energy efficiency funding.

Please see Attachment PUC 1-26, which shows past weatherization incentives.

c. Customers who have chosen to displace or replace their delivered fuel for heating have received rebates for high efficiency air source heat pumps. Please see the table below for the dollar amounts of rebates paid.

2019 ASHP Fuel Optimization Rebates

Fuel	Customer Count	Rebates Paid
OIL	188	\$582,384.50
PROPANE	13	\$41,266.66
Grand Total	201	\$623,651.16

PUC 1-27

Request:

When a natural gas customer receives a rebate for weatherization services, does a portion of the rebate come from the electric energy efficiency budget? If so, does this portion represent the cooling savings from weatherization?

Response:

Natural gas weatherization services are funded solely by the gas energy efficiency budget. Electric savings that result from weatherization are a secondary benefit that contribute to the gas portfolio benefit cost ratio, but are not claimed as electric savings in the electric portfolio.

PUC 1-28

Request:

As proposed in the Plan, if a customer switches from delivered fuels to natural gas, will the utility claim any energy savings associated with reducing a customer's former fuel source? If so, please explain.

Response:

The Company does not claim any energy savings associated with a customer's switch from a delivered fuel to baseline gas equipment.

Customer installation of energy efficient natural gas heat and water heating equipment produces claimable gas savings only. If a customer chooses to install energy efficient gas equipment, regardless of the fuel source that the customer is transitioning from, savings are calculated on the basis of the natural gas consumption of the new, efficient equipment relative to baseline (i.e. less efficient) gas equipment.

PUC 1-29

Request:

Are the net-to-gross ratios for conversions from delivered fuels negotiated or measured? Is the answer the same for the following:

- a. partial conversion;
- b. adding cooling or heating where previously there was none;
- c. reducing cooling load; and
- d. the decision to install higher-efficiency equipment in association with the fuel conversion?

Response:

The net-to-gross (NTG) value of 90% (assuming 10% free ridership) is a negotiated value that is proposed in the 2020 Energy Efficiency Plan. Pending approval of the 2020 Energy Efficiency Plan, the value will be used starting in 2020. (In Massachusetts, the 90% NTG value is a negotiated value that is currently being used per the approval of the 2019 – 2021 three-year Energy Efficiency Plan.)

The 90% NTG value is also a negotiated value for (a) partial conversion, (b) adding cooling or heating where previously there was none, (c) reducing cooling load, and (d) the decision to install higher-efficiency equipment in association with the fuel conversion. This 90% NTG negotiated value is used for all Oil/Propane to central ducted or mini-split heat pumps installations going through the Energy Star HVAC program."

PUC 1-30

Request:

Please provide a table in which the first column is all the benefits and costs in the RI Benefit Cost Framework, the second columns identifies if the benefits/cost category is quantified or qualified in the Plan, the third column is the quantification or qualification of the category, and the fourth column includes any notes National Grid would like to offer on the category or response.

Response:

Please see Attachment PUC 1-30 for the requested information.

Column (C) includes the benefit/cost category from the RI Benefit Cost Framework.

Column (D) indicates if that category is quantified, qualified, or neither in the Plan.

Column (E) includes the quantification or qualification of the category in the Benefit Cost Analysis for the Plan.

Column (F) provides a description of how the category is treated in the Benefit Cost Analysis for the Plan.

Column (G) provides an indicator of whether the category is a Benefit, Cost, or Undetermined value in the Benefit Cost Analysis for the Plan.

58		35	National Security and US international influence	Quantified	See Notes	National Security and US international influence benefits are included within the calculation of Non-Energy Impacts as described within the Non-Energy Impacts section of the 2020 Annual Plan (Bates 452-453), however they are aggregated with other Non-Energy Impacts and therfore their value is not broken out here.	Benefit

PUC 1-31

Request:

Considering all heat pumps offered as proposed in the 2020 Plan, is there a risk that the refrigerant used in these heat pumps will leak? If so, would these leaks pose any environmental or health costs and how are those costs captured in the benefit-cost analysis?

Response:

Any product, including air source heat pumps, that contains refrigerant has the potential to experience leaks. The risk is elevated if the equipment is not installed and/or maintained correctly.

Through the HVAC Electric program, the Air Conditioning and Mini-split Check (referred to in Plan documents and program implementation materials as "AC Check" and "MS Check") training and procedures provide information on proper installation and preventative maintenance to ensure proper commissioning and start-up and to help identify and prevent issues that could cause leaks.

As is consistent with the benefit cost modeling approach utilized for other measures that include refrigerant (high efficiency air conditioning systems and refrigerators, for instance), the potential environmental or health costs associated with any leaks that could result from the installation or operation of these systems are not included in the benefit-cost analysis for air-source heat pump measures proposed in the 2020 Plan.

PUC 1-32

Request:

National Grid's distribution customers invest in energy, capacity, and REC supply resources through contracts with for [sic] renewable energy facilities and by tariff with the Renewable Energy Growth Program facilities. Are the reductions in market revenue for these facilities' products considered in the benefit-cost analysis?

Response:

The Benefit Cost Analysis conducted for the 2020 Energy Efficiency Plan utilizes avoided costs from the Avoided Energy Supply Components in New England: 2018 Report (AESC 2018) and its supporting appendices. The developed avoided cost streams that monetize future electric energy savings in the benefit cost analysis include the cost of wholesale RECs. A major component of the development of the avoidable future REC costs includes forecasts of unavoidable renewable generation as a result of the following state policies:

- Rhode Island Renewable Energy Growth Program: 160 MW of contracts by 2019, followed by 35 MW of contracts per year (net of contract attrition) through 2029.
- Rhode Island Net Metering: 100 MW in service by 2022 under virtual net metering"²

Besides the incorporation of the avoided costs from the AESC 2018 study, the benefit-cost analysis of the energy efficiency portfolio is not otherwise adjusted to account for these factors. This includes reductions in market revenue for Renewable Energy Growth Program Facilities, as these costs are not "avoidable" in the sense that the term is typically used in applying avoided cost benefits to the benefit-cost analysis model of the energy efficiency portfolio.

¹ https://www.synapse-energy.com/sites/default/files/AESC-2018-17-080-Oct-ReRelease.pdf

² Avoided Energy Supply Components in New England: 2018 Report, Synapse Energy Economics, Inc., page 126.

PUC 1-33

Request:

National Grid's Technical Reference Manual includes many non-energy benefits. Please explain if the Technical Reference Manual includes any non-energy costs, such as participant time.

Response:

Currently there is no NEI for "participant time" in the Rhode Island TRM. As stated in Appendix E of the Rhode Island Technical Reference Manual (RI TRM), "Quantifiable benefits (beyond electric savings) that are the result of the installation of a measure. Fossil fuel, water, and maintenance are examples of non-electric benefits. Non-electric benefits (NEB) can be negative (i.e. increased maintenance or increased fossil fuel usage which results from a measure) and therefore are sometimes referred to as 'non-electric impacts'".

The RI TRM does contain NEBs with negative values. NEBs are more broadly categorized as Non-Energy Impacts (NEIs) and can include both positive and negative values. Negative NEIs can be understood to be non-energy costs. Measures with a negative NEI value include certain efficient heating equipment measures such as Boilers, Combined Heat and Power, Whole Building Heater, and Boiler Condensers. These measures have a negative NEI value due to a greater need for maintenance than the traditional less-efficient equipment they replace.

PUC 1-34

Request:

Referencing page 188 of the Plan, describe the time commitment for the customer for the audit and on-site work. Does the Benefit Cost Analysis account for this time commitment, and, if so, please describe how?

Response:

As referenced on Bates page 188 of the Energy Efficiency Plan, a home energy assessment generally takes two to three hours. The Benefit Cost Analysis does not account for this customer time commitment.

PUC 1-35

Request:

Please provide the benefit-cost analysis that support rejecting gas-to-electric heat pump space heating conversions or explain why none exists.

Response:

The Company has not prepared a benefit-cost analysis for gas-to-electric heat pump space heating conversions. Typically, the Company performs a benefit-cost analysis in support of measures that will be incentivized for customers. Referring to the information provided below, given current market realities, gas-to-electric heat pump space heating conversions do not currently provide favorable customer economics. As such, the Company has not proposed providing incentives or investing in the development of a market segment unlikely to produce near-term adoption or positive customer experience. There is no preclusion on customers who choose to pursue these conversions outside of energy efficiency programs or incentives, and the Company claims no savings or benefits in those scenarios.

On page 17 of the Rhode Island and Massachusetts "Ductless Mini-Split Heat Pump (DMSHP) Impact Evaluation" study (December 30th, 2016), ¹ the study states the following regarding the conversion from natural gas heat to mini-split heat pumps: "For natural gas, the figure shows a temperature breakpoint above 70F° for [the winters of 2015 and 2016], meaning a DMSHP would essentially never be cost-effective, compared with an 80% efficient heating system. This effectively means a DMSHP does not offer a viable direct replacement for a gas-fired system at today's energy prices."

In addition, the 2018 Rocky Mountain Institute Report "The Economics of Electrifying Buildings" by Sherri Billimoria, Leia Guccione, Mike Henchen and Leah Louis-Prescott, reports that in Providence, Rhode Island electrification of space and water heating and air conditioning costs are higher over the lifetime of the appliances when compared to performing the same functions with natural gas with existing air conditioning (see graph below).

² https://rmi.org/insight/the-economics-of-electrifying-buildings/

Net Present Cost of Space and Water and Heating and Air Conditioning (Thousands \$)

Source: https://rmi.org/insight/the-economics-of-electrifying-buildings/

PUC 1-36

Request:

Please provide the benefit-cost analysis that supports rejecting gas-to-electric heat pump water heating conversions or explain why none exists.

Response:

The Company has not prepared a benefit-cost analysis for gas-to-electric heat pump water heating conversions. Typically, the Company performs a benefit-cost analysis in support of measures that will be incentivized for customers. Given the low cost of gas currently, gas-to-electric heat pump water heating conversions do not produce favorable customer economics at this time. As such, the Company has not proposed providing incentives or investing in the development of a market segment unlikely to produce near-term adoption or positive customer experience. There is no preclusion on customers who choose to pursue these conversions outside of energy efficiency programs or incentives, and the Company claims no savings or benefits in those scenarios.

PUC 1-37

Request:

Please provide the benefit-cost analysis for gas heat pumps offered in this plan or explain why none exists.

Response:

The Company has not yet prepared a benefit-cost analysis for gas heat pumps. Gas heat pumps remain a nascent technology that the Company has not yet determined are an appropriate measure to include in energy efficiency programs.

The Company has proposed a C&I demonstration in the 2020 Energy Efficiency Plan, with a goal of verifying potential savings, benefits and barriers to customer adoption. With these questions addressed, the Company anticipates being in a better position to evaluate whether gas heat pumps should become a full-fledged measure within energy efficiency programs, including creation of associated benefit-cost models and development of a path to claiming savings associated with customer adoption of this technology.

PUC 1-38

Request:

Referencing the Joint Testimony on Bates Page 10, are the witnesses explaining the Plan is reliable because it continues to offer programs that were previously found to be best-in-class? If so, please provide the information that underlies this statement. If not, please provide further explanation of why the plan is reliable.

Response:

The Company does not consider the plan reliable solely because it continues to offer best in class programs, but rather because the programs offered in the Plan are improved upon with new implementation strategies, measures, and offerings, which is in compliance with the definition of "reliable" as stated in the Least Cost Procurement Standards at 1.2.D. Further, the Company engaged in a thorough review process of programs, down to the measure level, with the consulting team to the Energy Efficiency and Resource Management Council (EERMC) and other stakeholders through three drafts of the 2020 Annual Energy Efficiency Plan. The result is the most robust Plan offered to date, highlighting the offerings, process, customer feedback, proposed changes for the new program year, the rationale for those changes and upcoming evaluations. The Company believes that all of the above noted actions demonstrate the reliability of the Plan.

To support the Company's statement that the Plan offers "best in class" programs, the Company would point to the American Council for an Energy Efficiency Economy's (ACEE) 2019 State Scorecard. For Rhode Island, the scorecard allocated a perfect score to the category of "Utility & Public Benefits Programs & Policies."

PUC 1-39

Request:

Referencing the Joint Testimony on Bates pages 10 to 11, please provide the underlying information that supports the statement that the plan is offering "all achievable potential for 2020."

Response:

The Company believes that the 2020 Plan offers all achievable potential savings for 2020 while complying with the requirements of Least Cost Procurement since the Plan is cost effective, reliable, prudent and environmentally responsible.

The Company also believes that the 2020 Plan offers all achievable potential savings for 2020 since the savings goals proposed in the 2020 Plan were arrived at after an extensive engagement process throughout 2019 with external stakeholders at monthly Energy Efficiency Technical Working Group (TWG) and Energy Efficiency and Resource Management Council (EERMC) meetings.

Throughout this process, a detailed, iterative review and discussion of planned measures, programs, and resulting savings goals in the Plan was undertaken by the independent, third-party consulting team hired by the EERMC to support councilmembers tasked with representing the interests of Rhode Island energy consumers.

This process culminated with a certification by the third-party consultancy that the 2020 Plan as submitted was compliant with the Least Cost Procurement statute and a vote in favor of the Plan by the EERMC on October 3, 2019.

PUC 1-40

Request:

Referencing the Joint Testimony on Bates pages 12 to 13, please explain how "less expensive than the cost of additional energy supply" is calculated with consideration of delivered fuels. Are delivered fuels costs included as a part of an aggregated cost, or are the delivered fuel efficiency costs compared to delivered fuel energy costs separately?

Response:

The costs included in the cost of energy supply are noted in the 2020 EEPP in Table 4, Bates page 104. Fuel costs are included in the cost of energy supply calculation as excerpted below. Delivered fuel efficiency costs are not compared to delivered fuel energy costs separately. Rather, the costs of delivered fuel are considered in aggregate with the other costs considered in the cost of energy supply calculation.

Cost	Included	Explanation				
Fuel Costs	Yes	Non-regulated delivered fuels are an energy supply cost to customers				
		that utilize these fuels for heating. The fuel costs in this category are				
		separate from those embedded in the cost of the electric market.				
		While not a direct cost of electric energy supply, National Grid				
		includes incentives for delivered fuel energy efficiency measures in				
		its electric portfolio. Therefore, to achieve symmetry with costs				
		associated with electric energy efficiency, delivered fuels costs				
		should be included in this comparison.				

PUC 1-41

Request:

Please provide a single table with rows indicating all pilots, assessments, and demonstrations. Please make the columns the following:

- Cost
- Savings
- Years operated
- Report filed (yes/no)

Response:

Please refer to the table on the following page for the details requested on all pilots, demonstrations, and assessments proposed for 2020.

Name	Sector	Fuel		Budget (Co	st)	Savir	igs	Years Operated	Reports Filed****
			Gas	Electric	Total	Gas	Electric		
Pilots							_	_	
Gas DR	C&I	Gas	\$366,015		\$366,015	78.5 DTherms peak hour*		2018-2020	No

^{*}Peak hour DTherm reduction for the Gas DR Pilot, is an estimate and does not apply towards a formal target or shareholder incentive

**Correction: HVAC Lighting Control Plus is a dual fuel demonstration. Gas budgets for this demonstration were not updated in the Table 3,
Attachment 8, of the filed 2020 Energy Efficiency Plan. Gas budgets have been included as a correction in the table above. Corrections to
Table 3, Attachment 8 will be filed prior to the 2020 Energy Efficiency Plan hearing. Table G2 and G3, Attachment 6, Bates Page 481& 482
of the filed 2020 Energy Efficiency Plan, do include the gas budget associated with this demonstration.

^{***}The Innovative gas and electric demonstrations, for C&I, have been reclassified as "Assessments". The impact of this change will reduce the associated shareholder incentive by \$10,000. Corrections to the 2020 Energy Efficiency Plan will be filed prior to the 2020 Energy Efficiency Plan hearing date.

^{****} At this time no formal evaluation reports have been filed as all pilots, demonstrations and assessments have either not started or have not been in testing phase long enough for evaluations. Please refer to Tables 2,3,4,and 5, Attachment 8, Bates pages 515, 516 and 517 for evaluation method for pilots demonstrations and assessments. Attachment 8 also provides details on evaluation methodology, where applicable, for each pilot demonstration and assessment.

PUC 1-42

Request:

For each pilot, assessment, and demonstration, please provide the following:

- a. A short (e.g., about a single sentence) stating what question or issue is being tested.
- b. A list of the specific tests used to answer the question or issue above, the costs associated with each test, and how each test is designed to achieves [sic] new and useful information.
- c. A list of costs necessary to support the specific activities above.
- d. The timing of when results will be delivered for each activity.
- e. The format in which results will be delivered for each activity.

Response:

The Company has proposed the following 13 pilots, demonstrations and assessments in 2020:

- 1. Gas Demand Response (Commercial and Industrial)
- 2. Zero Energy Building Pilot (Commercial and Industrial)
- 3. Path to Zero Energy Home Pilot (Residential)
- 4. Performance Based Procurement Accelerate Performance (Commercial and Industrial)
- 5. Underutilized Energy Efficiency Technology on Mechanical Power Transmission Systems (Commercial and Industrial)
- 6. Strategic Energy Management SEM (Commercial and Industrial)
- 7. HVAC Lighting Controls Plus
- 8. Kitchen Exhaust Demonstration (Commercial and Industrial)
- 9. Absorption Air Cleaning (Commercial and Industrial)
- 10. Small Business Heat Pumps Demonstration (Commercial and Industrial)
- 11. Gas Heat Pumps Demonstration (Commercial and Industrial)
- 12. Emerging Lighting Market Interventions Secure Lighting Spec (SLS) Assessment (Commercial and Industrial)
- 13. Home Energy Score Evaluation Assessment (Residential)

Responses to each of the above questions are addressed below, by individually proposed pilot, demonstration or assessment. As a general rule (and as reflected in the responses below), it is typically not possible to isolate and assign or allocate specific costs to specific tests. For instance, costs associated with driving customer participation within a pilot are related to tests associated with identifying customer engagement and incentive strategies but are also a necessary precondition to measuring and validating ongoing savings and benefit impacts of this participation. As a result, for each pilot, demonstration, and assessment, the Company has identified the questions to be addressed and the test design proposed to inform answers to

PUC 1-42, page 2

identified questions. The Company has also identified budgeted costs broken down by cost category but cannot specifically link budgeted costs to specific tests.

1. Gas DR Pilot (Commercial and Industrial)

- a. The goal of the extended/expanded Gas DR pilot is to test the following: 1) strategies for C&I customer engagement, activation and compensation related to participation in demand response activities related to reducing customer usage of natural gas during periods of peak demand, and 2) once enrolled, a customer's ability to participate in events in a manner which has meaningful impact on gas demand during these periods.
- b. The Company intends to address the following questions during this pilot:

Question	Form of test
Can RI gas C&I customers be incentivized to participate in gas demand response events with 3 or 24 hour event windows? [3-hour events – Peak Period Demand Response (PPDR), 24-hour events – Extender Demand Response (EDR)]	Level of customer enrollment as a function of identified addressable market
Will enrolled customers reliably participate in in called events, absent utility managed direct load control?	Average metered reductions in demand relative to customer baselines, customer committed capacity
Will customers who participate in three-hour events demonstrate reduced consumption over a full (24-hour) gas day, or will reduction consumption during the peak 3 hour window simply be shifted within the peak gas day?	Comparisons of 'Peak Period Demand Response' customer participants full gas day usage to baseline consumption for those customers on non-demand response event days

PUC 1-42, page 3

c. A list of costs associated with the pilot:

Pilot Activity	Marketing & Advertising	Participant Incentive	Program Planning and Administration	Sales Training and Technical Assistance	Total
Budget for six customer enrollments in PPDR and 2 customers in EDR	\$ 9,524	\$ 266,775	\$ 54,232	\$ 35,484	\$ 366,015

d. Timing for delivery

- Learnings from the winter 2019/2020 (both recruitment and ensuing customer participation) will be available at the end of the Winter Gas DR season – in the Spring of 2020.
- Learnings from recruitment activities leading into the Winter of 2020/2021 will be available by the end of 2020. Additional observations based on customer participation patterns during the Winter of 2020/2021 will be available in the Spring of 2021
- e. Learnings and results (customer enrollment, costs, resulting aggregate demand reduction during peak periods) from the Gas DR pilot will be communicated in the Energy Efficiency Quarterly Reports that the Company files with the PUC following each calendar quarter.

2. Zero Energy Building Pilot (Commercial and Industrial)

a. The purpose of the Zero Energy Building (ZEB) pilot is to test whether the Zero Energy Building Pilot program design, which supports individual projects and provides education and training information to building and industry professionals, can successfully drive market participation in Zero Energy Buildings in Rhode Island.

PUC 1-42, page 4

b. The Company intends to address the following questions during this pilot:

Question	Form of Test
Can the current pilot design that supports	Customer participation in pilot program.
projects in goal setting, incentives, technical	Achievement of Zero Energy Building
assistance, operations and maintenance	goals at design.
planning, monitoring and documentation drive	
customers to participate in the pilot program	
and achieve Zero Energy building goals?	
Will the buildings that do participate in Zero	Achievement of Zero Energy Building
Energy Building pilot maintain Zero Energy	goals after one year of operation of the
levels after one-year of occupancy?	occupancy of the project.

c. A list of costs associated with the pilot for enrollment of two projects:

Pilot Activity	Evaluation & Market Research	Marketing & Advertising	Participant Incentive	Program Planning and Administ ration	Sales Training and Technical Assistance	Total
Electric	\$ 20,000	\$ 22,000	Participant incentive payout expected in 2021 and is not included in 2020 budget	\$ 16,269	\$ 48,000	\$106,269

d. Timing for delivery:

Expected enrollment of two ZEB projects in 2020 that will be completed in the 2021-2022 time-frame. Updates on projects will be available in Q3 of 2020 and performance and achievement of ZEB design status will be available in 2021.

e. Learnings and updates (customer enrollment, costs, ZEB goal setting achievement for two projects) will be communicated in the Energy Efficiency Quarterly Reports that the Company files with the PUC. ZEB goal achievement from participating projects will be provided in 2021-2022 (these updates are subject to participation in the ZEB pilot program).

PUC 1-42, page 5

3. Path to Zero Energy Home Pilot (Residential)

- a. The Path to Zero Energy Ready was established to inject funds into the market to build professional capabilities and test market acceptance, provide training for building professionals, demonstrate proof-of-concept and assist with incremental cost of zero energy.
- b. The Company intends to address the following questions during this pilot:

Question	Form of Test
Can the current pilot design that supports	Contractor and customer
awareness, technical training, incentives,	participation in pilot program.
marketing, monitoring and documentation	
drive customers to participate in the pilot	Enrollment of projects that achieve
program and achieve Zero Energy goals?	Zero Energy goals at design stage.
Will Zero Energy Homes maintain Zero	Achievement of Zero Energy goals
Energy levels after one-year of occupancy?	after one year of operation of the
	occupancy of the project.

c. A list of Costs associated with the pilot:

Pilot Activity	Evaluation & Market Research	Marketing & Advertising	Participant Incentive	Program Planning and Administr ation	Sales Training and Technical Assistance	Total
	\$ 17,000	\$ 26,000	\$ 190,000	\$ 10,846	\$ 44,000	\$ 287,846

d. Timing for delivery:

The results for the activities occur throughout the year. Expected enrollment of five new Zero Home Energy projects in 2020, that the Company will complete in 2021-2022 timeframe. Updates on projects will be available in Q3 of 2020 and performance and achievement of Zero Energy design status will be available in 2021.

e. The format in which results will be delivered for each activity: Activities are delivered through the following formats

PUC 1-42, page 6

Category	Format in which results will be delivered			
Awareness	Newsletter articles, attending/presenting at public events			
Technical Training	Increase Industry Knowledge (training), Increase Professional			
	Certifications, Zero Energy Workshops			
Accelerating	Project Certification, Project Certification Builder Incentives			
Performance	(upon completion), Promote & support			
Marketing	Case studies, fact sheets, website, Zero Energy Workshop			

Learnings and updates (customer enrollment, costs, Zero Energy goal setting achievement all applicable projects) will be communicated in the Energy Efficiency Quarterly Reports that the Company files with the PUC. ZEB goal achievement from participating projects will be provided in 2021-2022 (these updates are subject to participation in the ZEB pilot program).

4. Performance Based Procurement (Accelerate Performance) Demonstration (Commercial and Industrial)

- a. The goal of the Performance Based Procurement (Accelerate Performance) demonstration is to determine whether engaging with the building owner in early stages of a design project and setting Energy Use Intensity (EUI) goals for the design team can drive achievement of deeper energy efficiency and achievement of the EUI goals set for the project.
- b. The Company intends to test the above question by engaging two customers/building owners in this demonstration. The information gathered from this demonstration will help inform the New Construction Program process of engaging with owners and design teams, interventions needed in the process and, timing of interventions to achieve EUI goal. Participating project owners, as part of the demonstration design receive utility design support with an "owners' representative" on the team, who will stay engaged through the design and process of the project. The project will avail incentives through the existing New Construction program.

PUC 1-42, page 7

c. Costs associated with Performance based Procurement Demonstrations: Two project participation

Performance	Participant	Program	Sales	Total
based	Incentive	Planning and	Training and	
Procurement		Administration	Technical	
(Accelerate			Assistance	
Performance)				
Demonstration				
Gas	Customer	\$ 2,711	\$ 7,000	\$ 9,711
Electric	incentive for this initiative is budgeted from existing New Construction program budgets.	\$ 8,134	\$ 21,000	\$ 29,134
Total				\$38,845

- d. Results and delivery of this demonstration depends upon customer project timelines.
- e. Demonstration updates and results from the two demonstration projects will be presented in the Energy Efficiency Quarterly reports in 2020.

5. Underutilized EE technology on mechanical power transmission systems (Commercial and Industrial)

- a. The goal of this demonstration is to test if providing technical expertise, educational and training information to small and medium sized manufacturing facilities to conduct comprehensive compressed air supply and demand side system assessments will result in cost-effective savings from optimizing both supply and demand energy performance of small and medium size facilities.
- b. For this above stated demonstration, the Company will:
 - 1) Engage with three customer facilities;
 - 2) Conduct four webinar series with all customers;
 - 3) Conduct field studies at three selected customer sites. This will include instrumentation to measure pressure, flow and power at these sites. Collection of

PUC 1-42, page 8

customers' facilities data for the duration of the measurement process (one-week duration per site)

- 4) Analyze the data collected and share findings and recommendations for improvements for each site the customer. Information gathered from these three test sites will be used to determine answers to the question posed by the demonstration (as stated in response PUC 1-42 5.a. above)
- c. Costs associated with this demonstration for three facilities include:

Underutilized EE tech. on mechanical power transmission systems Demonstration:	Participant Incentive	Program Planning and Administration	Sales Training and Technical Assistance	Total
	\$ 100,000	\$ 21,693	\$ 130,000	\$ 251,693

- d. Time to delivery for each activity at start of project
 - 1) Customer engagement 11 weeks
 - 2) Four Webinars 9 weeks
 - 3) Field Study 20 weeks
 - 4) Analysis and reports 6 weeks

This demonstration will begin in Q2 of 2020 upon approval of the 2020 Energy Efficiency Plan.

e. Demonstration updates and results from the three customer sites as part of this demonstration project will be presented in the Energy Efficiency Quarterly reports in 2020 and 2021

6. Strategic Energy Management (SEM) (Commercial and Industrial)

a. The primary question being tested with Strategic Energy Management/Continuous Energy Improvement (SEM/CEI) is: Can SEM/CEI establish a culture of continuous improvement that will lead to longer-term improvements in energy performance, including the customers' ability to identify and act on operations and maintenance measures in the short-term and address capital measure in the medium to long-term.

PUC 1-42, page 9

b. The test is initiated through a multiplicity of interventions, including individual and group coaching, and cohort workshops. Additionally, the Strategic Energy Management/Continuous Energy Improvement implementation partner leads customers on activities such as energy treasure hunts, where the customer and vendor walk the facility looking for energy efficiency opportunities and quick-to-implement energy savings measures. The primary objective of the tests is to enact a set of processes for business energy management that will lead to continuous, direct energy savings.

Specifically, the workshops and energy treasure hunts are designed to implement a process where the customer can identify and implement operation and maintenance energy savings. Whereas the interventions and coaching are designed to achieve a process of continuous energy improvement by demonstrating the financial and operational benefits of energy efficiency.

- c. The Strategic Energy Management/Continuous Energy Improvement costs are not broken down by test, rather there is a set and established budget of \$395,200 for electric and \$124,800 for gas. The budgets encompass the delivery of this demonstration through an experienced vendor who the Company has engaged for this demonstration.
- d. The Strategic Energy Management/Continuous Energy Improvement demonstration is set to continue through 2020. The SEM/CEI demonstration will undergo a review by an external evaluation firm (as recommended by the consultants to the Energy Efficiency Resource Management Council) during the first quarter of 2020 to ensure the vendor's site-specific regression model is collecting all relevant data to claim savings as well as collecting information that may be needed for a robust evaluation. Additionally, the Company will look to understand if the demonstration is producing energy savings that are expected based on examples from other jurisdictions that have implemented SEM/CEI.
- e. Savings results from this demonstration will be presented as part of the Energy Efficiency Annual Report for 2020.

7. HVAC Lighting Controls Plus Demonstration (Commercial and Industrial)

a. The purpose of HVAC Lighting Controls Plus demonstration is to 1) test and determine the energy savings impacts and non-energy benefits of enhancing the

PUC 1-42, page 10

Company's existing Performance Lighting PLUS (PL+) initiative with a networked lighting package that includes integration with Power Over Ethernet, and HVAC controls, and to 2) Discover the project cost and customer acceptance of using networked lighting controls to control systems beyond just lighting.

- b. This demonstration will be conducted in four steps to answer the questions above.
 - 1) High level energy modeling using base case as an ASHRAE 90.1-2013 compliant building located in Providence, Rhode Island to determine the magnitude of energy savings potential of Network Lighting Controls+ systems, HVAC Controls Upgrade to lighting system with networked lighting controls Implement HVAC controls: predominately demand control ventilation (or ventilation reset) and thermostat setbacks;
 - 2) Detailed modelling of Rhode Island building types;
 - 3) Customer acquisition and deployment of the demonstration;
 - 4) Analysis and learnings for program integration into an HVAC Lighting Controls Plus initiative.
- c. Costs associated with this demonstration and tests are: 4-6 customer sites

HVAC Lighting Controls Plus Demonstration:	Participant Incentive	Program Planning and Administra tion	Sales Training and Technical Assistance	Total
Gas	Customer incentives	\$ 5,423	\$ 113,333	\$ 118,756
Electric	for this demonstration are part of existing lighting and HVAC program offerings. Additional incentives structure to be determined if necessary, after step 2 detailed in response 7.b. of PUC I-42	\$ 10,846	\$ 226,667	\$ 237,513
Total				\$ 356,269

PUC 1-42, page 11

- d. This demonstration will have the following activities and timelines from project start:
 - Test 1 Modeling 4-6 weeks from project start. This activity was completed in September of 2019. High level savings potential from the modelling has been determined. (This activity is not included in the 2020 costs associated with this demonstration, information provided in this test is to present the details of this demonstration from start to finish)
 - Test 2 Detailed modelling 8 weeks. Detailed savings potential for specific building types in Rhode Island.
 - Test 3 Customer acquisition and deployment at 4-6 customer sites, 7-12 months from project start. This test will provide information on cost and customer acceptance of the proposed program design for this demonstration.
 - Test 4 Analysis and Monitoring & Verification at 4-6 customer sites, 12-16 months from project start and after installation and operation.
 - This demonstration will start in Q1 of 2020 upon approval of the 2020 Energy Efficiency Plan.
- e. Results from the analysis including customer costs and acceptance analysis will be presented as part of Rhode Island Energy Efficiency Quarter Reports.

8. Kitchen Exhaust Demonstration (Commercial and Industrial)

- a. To test three potential strategies to reduce energy use in commercial kitchen exhaust systems and if successful incorporate these strategies into the existing program offerings.
- b. Strategies to be studied and tested are: electrostatic filtration, behavior-change campaigns and demand control ventilation. To test these strategies the demonstration will be divided into four steps.
 - 1) High level energy modeling to determine the magnitude of energy savings from each strategy in commercial kitchen exhaust systems. Costs associated with this effort are presented in response 8.d of PUC 1-42.

PUC 1-42, page 12

The following steps will continue in 2021 timeframe if the strategies and savings from step 1 show promising results.

- 2) Customer acquisition and agreement for installation of air cleaning systems and monitoring equipment in 5 commercial kitchens.
- 3) Monitoring of systems before and after air cleaning systems, so that baselines performance can be determined. Monitoring of systems for 8 months after installation of air filtration systems and implementation of strategies to determine savings potential.
- 4) Analysis of data, qualitative and quantitative to determine potential for integrating into existing programs.
- c. Costs associated with this demonstration:

Kitchen Exhaust Demonstration:	Participant Incentive	Program Planning and Administration	Sales Training and Technical Assistance	Total
Gas	Customer	\$ 10,846	\$ 8,000	\$ 18,846
Electric	incentive is not	\$ 5,423	\$ 4,000	\$ 9,423
	budgeted for			
	2020			
Total				\$28,269

- d. High level energy modeling will take 4-6 weeks from start of this demonstration. This demonstration will begin in Q1 of 2020.
- e. Results from the energy modeling analysis will be presented as part of Rhode Island Energy Efficiency Quarter Reports.

9. Absorption Air Cleaning (Commercial and Industrial)

a. The goal of Absorption Air Cleaning demonstration is to determine a) the barriers to adoption of this technology and to determine a strategy to scale participation of this technology within programs c) Measuring energy savings and monitoring to ensure that indoor air quality (IAQ) is not compromised with this technology.

PUC 1-42, page 13

b. The company intends to address the following questions with this demonstration:

Question	Form of test
Can RI C&I customers be incentivized	Customer enrollment in this
to adopt this technology?	demonstration
What strategy can be employed to scale	Research of technology adoption in
participation?	other utility programs, customer sites
	and conduct interviews with National
	Grid staff and its implementers, other
	key stakeholders such as manufactures,
	their reps, engineers and contractors.
What are the impacts from this	Measurement and data collection from
technology on savings and IAQ?	customer sites to determine savings
	and IAQ results as well as
	documenting challenges with
	implementing technology in existing
	buildings.

c. Costs associated with this demonstration include implementing this technology in 2-3 customer sites:

Absorption Air Cleaning Demonstration:	Participant Incentive	Pla	ogram anning and Iministration	and Ted	aining	То	tal
Gas	Customer incentive will	\$	10,846	\$	160,000	\$	170,846
Electric	be part of existing program budget	\$	5,423	\$	80,000	\$	85,423
Total						\$	256,269

PUC 1-42, page 14

- d. This demonstration will take 18 months to complete from start to finish. Timing for delivery include the following steps with some overlap in steps
 - 1) Background research and interviews 12 weeks
 - 2) Customer acquisition 16 weeks
 - 3) Monitoring 36 weeks
 - 4) Analysis and learnings 30 weeks

This demonstration will begin in Q2 of 2020.

e. Results from this demonstration will be presented as part Rhode Island Energy Efficiency Quarter Reports in 2020 – 2021.

10. Small Business Heat Pumps demonstration (Commercial and Industrial)

- a. The goal of this demonstration is to determine barriers to adoption, incentive structure, technical and monitory, to scale electric heat pumps in the small business customer vertical.
- b. The company intends to address the following questions with this demonstration:

Research of technology adoption in
other utility programs and customer sites. Conduct interviews with implementers, other key stakeholders such as contractors, sub-contractors, manufactures and their reps, to
determine barriers to adoption
Customer enrollment in this
demonstration
Process and impact evaluation of installing electric heat pumps in small business application
si in su m de C de Pi

PUC 1-42, page 15

c. Cost associated with installing electric heat pumps in 30 customer locations are:

Small Business Heat Pump Demonstration	Marketing & Advertising	Participant Incentive	Program Planning and Administration	Sales Training and Technical Assistance	Total
Electric	\$ 20,000	\$ 207,900	\$ 21,693	\$ 29,700	\$ 279,293

- d. Delivery and timing for this demonstration requires the following steps:
 - 1) Research and interviews Initial research and interviews were completed in Oct 2019
 - 2) Customer acquisition 6 months from start. This stage is expected to launch in Q2 of 2020
 - 3) Process and Impact evaluation 12 months
 - 4) Analysis and learnings 3 months
- e. Results from this demonstration will be presented as part Rhode Island Energy Efficiency Quarter Reports in 2020 and 2021.

11. Gas Heat Pumps Demonstration (Commercial and Industrial)

- a. The purpose of the Gas Heat Pump demonstration is to research savings potential within RI from this technology.
- b. To determine the savings potential the Company will: 1) engage with existing customers in the Northeast who have installed this technology to determine savings, barriers to installation and key customer site criteria needed to make this technology viable for customers. 2) The Company will then apply this customer site criterion to the existing customer base in RI, to determine the total technical savings potential based on the number of customers that have the potential to install this technology in RI (includes athletic facilities, pools, food and beverage processing plants, hotels and multi-family residential buildings)

PUC 1-42, page 16

c. Costs associated with this demonstration are:

Gas Heat Pump Demonstration	Participant Incentive	Program Planning and Administration	Sales Training and Technical Assistance	Total
Electric	There is no participant/cust omer incentive associated with this demonstration	\$ 16,269	\$ 11,000	\$ 27,269

- d. Timing and activities for implementing this demonstration are:
 - 1) Customer research and case studies 4 months
 - 2) Savings potential in RI 2 months

This demonstration will begin in Q1 of 2020, on approval of 2020 Energy Efficiency Plan.

e. Results from this demonstration will be presented as part of Rhode Island Energy Efficiency Quarter Reports in 2020.

12. Emerging Lighting Market Interventions Secure Lighting Spec (SLS) Assessment (Commercial and Industrial)

- a. Does integration within Lighting Manufacturers Representative (LMR) process create an increase in projects, and therefore savings, in code-based lighting incentive offerings.
- b. Understand LMR process. Insert code-base lighting specifications into design and bid process, possibly through the LMR platforms. Measure participation change. Learnings from this demonstration will inform if the direct insertion in the LMR process increase quantity of code-based lighting projects.
- c. Costs associated with this Assessment are to engage with one Lighting Manufacturers Representatives and determine measure participation change.

PUC 1-42, page 17

Emerging Lighting Interventions SLS Assessment	Participant Incentive	Program Planning and Administration	Sales Training and Technical Assistance	Total
Electric	There is no participant/customer incentive associated with this assessment	\$ 16,269	\$ 27,628	\$ 43,897

- d. The timing for each activity to accomplish this demonstration are:
 - 1) Engaging with Lighting Manufacturers Representative to develop solution This has been completed in 2019
 - 2) Tool development to insert code-based lighting specifications into design bid process 6 months
 - 3) Deployment with one LMR 3 months
 - 4) Measure participation change 6 months

This demonstration will begin in Q1 of 2020, on approval of 2020 Energy Efficiency Plan.

e. Findings from this Assessment will be provided as part of the Rhode Island Energy Efficiency Quarter Reports in 2020.

13. Home Energy Score Evaluation Assessment (Residential)

- a. In 2018 and 2019, National Grid implemented an assessment of the United States Department of Energy's Home Energy Score (HES) asset-based score. In 2020, this assessment will be evaluated within the EnergyWise evaluation to determine if additional savings were achieved over standard weatherization.
- b. The HES evaluation will be a subset of the overall EnergyWise evaluation. An estimate of \$10,000 has been budgeted for the HES portion of the study.
- c. \$10,000 has been budgeted for the HES evaluation.
- d. Evaluation will be completed in 2020.
- e. Findings will be provided within the EnergyWise evaluation report.

PUC 1-43

Request:

For the gas DR pilots, please explain how the proposed activities are different (test something different) from activities in New York and Massachusetts. Are the activities known to be different from work in any other jurisdiction?

Response:

The Company believes that there are several aspects of the proposed Gas DR pilot that will produce distinct learnings compared with those available from gas demand response pilot activities previously undertaken in New York and Massachusetts.

First, the composition of commercial and industrial customer gas demand is different in Rhode Island than in National Grid's Massachusetts and New York service territories. The proposed Gas DR pilot will provide Rhode Island specific insight into the potential impact and participation profiles of enrolled and participating customers relative to the overall gas system in Rhode Island.

Additionally, the proposed Gas Demand Response pilot differs from previously executed pilots in other jurisdictions in the following ways:

- The proposed pilot includes multiple tiers of potential customer participation, offering customers the option to participate in either three- hour or twenty-four-hour curtailment programs.
- The proposed pilot offers a modified incentive structure, offering customers a combination of availability payments and energy payments incentives. Availability payments incentives, which are based on committed and demonstrable capacity, are incentive payments for customers to remain ready to participate in demand response events during the demand response season. Energy payments incentives are earned payments based on delivered reductions when events are called.
- The proposed pilot is based upon customer initiation and control of curtailment during events, not upon utility-initiated direct load control. While the Company intends to concurrently pursue this approach in an expanded pilot in downstate NY, it has not previously been tested by the Company outside of the single customer participating in a pilot led by Fraunhofer Center for Sustainable Energy in Massachusetts.

PUC 1-44

Request:

For the gas DR pilots, are the pilots focused on constraints on the distribution system, transmission system, or both?

Response:

Generally, the purpose of the Gas DR pilots is to understand customer appetite and ability to participate in gas demand response events, the appropriate incentive and performance payment structures required to drive this enrollment and ongoing participation, go to market and customer recruitment strategies, and to confirm the reliability of customer participation in gas demand response events when called.

Depending on the specific nature of customer demand and available transmission and distribution infrastructure and gas supply in specific areas, these pilots could provide support for distribution and transmission system constraints in addition to reducing Company gas procurement costs through allowing for a lesser volume of gas supplies to be purchased at times when those costs are typically high.

The "Peak Period Demand Response" program (i.e. the three-hour curtailment program) would be most likely to provide distribution level constraint relief, while the "Extended Demand Response" program (i.e. the full gas day curtailment program) would be more likely to provide relief on potential transmission system constraints.

PUC 1-45

Request:

Please list all demand response (DR) pilots that are focused on shifting energy use to times when energy can be procured at a lower cost, rather than DR that is focused on offsetting or eliminating the need for capital investment. Please list all DR pilots that are focused on offsetting or eliminating the need for capital investment.

Response:

The proposed gas demand response pilot expansion is the only demand response pilot proposed in the 2020 Energy Efficiency Plan.

The purpose of this pilot expansion is to further test and understand customer appetite and ability to participate in gas demand response events, the appropriate incentive and performance payment structures required to drive this enrollment and ongoing participation, and the potential impact and benefit of customer participation in gas demand response programs.

Specifically, the single proposed gas demand response pilot is not exclusively focused on either time shifting for cost avoidance or offsetting/eliminating the need for capital investment. The pilot is designed to test a gas demand response program's ability to provide both. The Company believes that gas demand response has the potential to reduce Company gas procurement costs through allowing for a lesser volume of gas supplies to be purchased at times when those costs are high. Additionally, at sufficient scale and with sufficiently demonstrated reliability (both dimensions which the proposed pilot expansion is designed to inform), gas demand response also offers the potential for offsetting or eliminating the need for capital investment in gas infrastructure.

PUC 1-46

Request:

Referencing the Joint Testimony on Bates page 49, please explain if Strategic Energy Management/Continuous Energy Improvement has any direct savings, and how those savings are achieved.

Response:

Strategic Energy Management/Continuous Energy Improvement is both a commercial and industrial customer engagement tool for driving customer actions that produce direct savings as well as a process through which these savings are calculated and documented via site-specific regression models.

Strategic Energy Management/Continuous Energy Improvement achieves direct savings through a variety of interventions, including individual and group coaching, as well as through activities such as energy treasure hunts where the vendor and customer walk the facility in search of energy saving opportunities. When these activities lead to direct savings (as calculated and documented via the regression model approach highlighted above), those savings are attributed directly to the Strategic Energy Management/Continuous Energy Improvement demonstration.

In addition to behavioral/operations and maintenance measures that can produce savings on their own, without incremental capital investment by the customer, these activities can also result in the identification of savings opportunities which are dependent upon the installation of new equipment at the customer site in order to achieve identified savings opportunities. To the extent that this new equipment includes cost-effective measures, these installations can be eligible for additional energy efficiency program incentives, and savings resulting from these installed measures are tracked and claimed within complementary programs (most typically Commercial & Industrial Retrofit) via standard approaches for these measures.

PUC 1-47

Request:

Referencing the Joint Testimony on Bates page 52, are the savings from gas heat pumps solely based on manufacturers' claims?

Response:

The Company's estimated savings for gas heat pumps, presented in Attachment 8, Table 3, Bates page 516, are based on manufacturers' claims and research and development work done by the Energy Solutions Center, Inc. (ESC). ESC is a non-profit organization of energy utilities and equipment manufacturers that promotes energy efficient natural gas solutions and systems for use by residential, commercial, and industrial energy users.

ESC conducted a study and analysis of nine technologies as a component of a study identifying energy efficient gas solutions that could be deployed to maximize commercial customer Return on Investment (ROI).

Gas heat pumps were one of the nine technologies evaluated as part of this study, and savings estimates determined by this study were used to validate manufacturers' claims in preparing the savings estimates conveyed in Attachment 8, Table 3.

PUC 1-48

Request:

Referencing the Joint Testimony on Bate page 45 and Bates pages 515 to 516 of the Plan, "innovations" are contained within demonstrations for both gas and electric and the expected savings from each are described as "unknown." The Plan states that "Demonstrations" will contribute savings to the programs in which they are offered and are included in costs, benefits, and savings and in the calculation of the performance incentive. Please explain how, since the savings from Innovations are unknown, the \$200,000 budget for Innovations are included in the calculation for the incentive.

Response:

The Innovation demonstrations for both gas and electric, as referenced on Table 2 and 3, Bates pages 515 and 516, have been reclassified as "Assessments," as the savings from these efforts are unknown and will not be claimed towards the Company's 2020 savings targets.

The impact of this reclassification will reduce the associated shareholder incentive by \$10,000. To accurately reflect this change, prior to the 2020 Energy Efficiency Plan hearing, the Company will file corrections to the following attachments: Attachment 5, Tables E-2 and E-3, Bates pages 467 and 468; Attachment 6, Tables G-2 and G-3, Bates pages 481 and 482; Attachment 8, Tables 2 and 3, Bates pages 515 and 516.

PUC 1-49

Request:

Please list in a table all measures, programs, pilots, etc. that are eligible to count toward the System Efficiency performance incentive. Include columns that show the demand reduction expected, the performance incentive, total costs, total benefits, and the benefit-to-cost ratio. Please include the expected shareholder incentive from the System Efficiency performance incentive in total costs.

Response:

The programs with demand reduction savings that qualify for the System Efficiency performance incentives (also called the System Efficiency Performance Incentive Mechanism [PIM]) are:

- Residential ConnectedSolutions
- Commercial ConnectedSolutions

Please see Attachment 1, Table 2, Bates page 250 of the 2020 Energy Efficiency Plan for the list of measures included in the Residential ConnectedSolutions program and the anticipated units and customer incentives associated with each measure.

Please see Attachment 2, Table 1, Bates page 372 of the 2020 Energy Efficiency Plan for measures (collectively referred to as 'subprograms') included in the Commercial ConnectedSolutions program, including associated customer incentives.

Total costs, total benefits and the resulting benefit-cost-ratio are calculated at the program level and not at the measure (or sub-program) level.

Please see the table below for program level information regarding the following: demand reduction, program level performance incentive, program level total costs, program level total benefits, and program level benefit-to-cost ratios that includes the System Efficiency performance incentive in total costs.

PUC 1-49, page 2

Programs	Active Demand Reduction Expected (kW)	Performance Incentive (\$)	Implementation Costs (\$)	Total Benefits (\$)	Benefit to Cost Ratio (Costs include performance incentive)
Residential Connected Solutions	1,672	\$20,540	\$461,627	\$1,697,118	3.52
Commercial Connected Solutions	49,000	\$601,830	\$2,078,479	\$27,031,185	10.09
Total	50,672	\$622,370*	\$2,540,106	\$28,728,303	9.08

^{*}The maximum earnable performance incentive for the System Efficiency PIM in 2020 is capped at 25 MW of demand reduction (and \$622,370 in earned performance incentive), per the terms of Article II, Section C.19.a of the Amended Settlement Agreement in RIPUC Docket Nos. 4770/4780, Bates page 70.

PUC 1-50

Request:

How are savings from demonstrations included in National Grid's targets for calculation of the shareholder incentive? Please confirm there are demonstrations for which savings are unknown.

Response:

As each demonstration tests a new technology or solution as part of an existing program (refer to Attachment 10, Bates page 562 for definitions), the demonstration budgets roll up into associated program budgets.

Because demonstrations are executed as part of existing programs, savings targets are not explicitly linked to demonstrations. Instead, demonstrations are a component of individual program strategies, and, as such, help to establish the programmatic savings expectations that roll up to sector and portfolio level savings targets. Savings realized during demonstrations do contribute to reported savings and towards the Company's achievement of performance incentives.

The two innovation demonstrations under C&I gas and electric have been reclassified as "Assessments," as estimated savings from these efforts are currently unknown. The budgets for these efforts have been removed from associated shareholder incentive calculations.

The impact of the reclassification of these "Demonstrations" to "Assessments" will reduce the associated shareholder incentive by \$10,000. To accurately reflect this change, prior to the 2020 Energy Efficiency Plan hearing, the Company will file corrections to the following attachments: Attachment 5, Tables E-2 and E-3, Bates pages 467 and 468; Attachment 6, Tables G-2 and G-3, Bates pages 481 and 482; Attachment 8, Tables 2 and 3, Bates pages 515 and 516.

PUC 1-51

Request:

Please compute the incentives National Grid would have earned in the previous five years had the new incentive designs (both the targets and budget-target adjustments) been in place. Please break out performance by Core, Delivered Fuel, and Gas and report this in a table. In the same table, please provide the percentage of the redesigned target incentive National Grid would have achieved and the percentage of the allowed target incentive National Grid did achieve.

Response:

The Delivered Fuel component of the Company's proposed performance incentive mechanism for 2020 cannot be directly applied to past year's results for two reasons:

- 1) The Company did not produce savings goals for delivered fuel to air-source heat pump conversions in prior years, so there would be no target against which to compare realized air source heat pump savings in order to calculate that measure's contribution to a Delivered Fuel component of the performance incentive mechanism.
- 2) In the 2020 plan, the Company applied updated energy savings impacts for heat pumps based on an Energy Optimization study conducted by Navigant in the fall of 2018. This study analyzed a selection of fuel switching measures that were evaluated for the Massachusetts Program Administrators' 2019-2021 three-year plan. As part of this study, Navigant included savings estimates for converting from oil or propane to both high efficiency ducted heat pumps and mini-split heat pumps and looked at this both from a partial displacement scenario (existing equipment remains on-site) and a full displacement scenario (existing equipment is removed and ducted/mini-split heat pump provides all the heating load). These measure scenarios were set up specifically with fuel switching involved and due to this, National Grid feels these estimates are more accurate than the older study that was the basis for heat pump savings in prior years. Past heat pump savings were based on the customer moving from a less efficient ducted/mini-split heat pumps to a high efficiency ducted/mini-split heat pump in a lost opportunity methodology.

Because the savings values are not comparable between years in the planned or tracked data, the comparison of the performance under each scenario would not be comparable.

In light of this, the Company has instead developed schedules showing how performance incentive achievement for electric energy (kWh), electric demand (kW) and natural gas energy (MMBtu) would have been impacted had the spending vs. budget rules proposed in the 2020

plan been in place in those years. Please see Attachments PUC 1-51-1, 1-51-2, and 1-51-3 for these comparisons.

As demonstrated in the attachments, in the vast majority of instances, these rules would have had no impact on the performance incentive earned by the Company in each fuel, sector, year combination. In those specific situations where the proposed changes would have led to a different performance incentive payout, a description of the magnitude and driver of each change is provided below:

Electric Energy (kWh) changes:

- Attachment PUC 1-51-1, Line 5. The 2017 Non-Income Eligible Residential performance incentive would increase by \$32,397 under the 2020 proposed budget rules. This change is triggered because of the overachievement of savings compared to goal while expenditures were kept below 100% (as opposed to the 95% of budget threshold in place in 2017).
- Attachment PUC 1-51-1, Line 9. The 2016 Commercial & Industrial performance incentive would increase by \$266,766 under the 2020 proposed budget rules. This change is triggered because savings are under 100% of goal but the amount that savings fell short of 100% of goal was smaller than the amount by which expenditures were below 100% of budget and the Company therefore would have received an increase in performance incentive earned relative to design level.
- Attachment PUC 1-51-1, Line 15. The 2014 Commercial & Industrial performance incentive would increase by \$198,627 under the 2020 proposed budget rules. This change is triggered because savings are under 100% of goal but the amount that savings fell short of 100% of goal was smaller than the amount by which expenditures were below 100% of budget and the Company therefore would have received an increase in performance incentive earned relative to design level.
- Attachment PUC 1-51-1, Line 5. In the 2018 Non-Income Eligible Residential program, there is a difference of \$3,347 from actual earnings and the earnings calculated using the newly-proposed 2020 budget levels. Note that this change does not arise from a change in the budget rules. In the 2018 annual report the earned performance incentive for this sector was revised downwards by \$3,347 to account for a change to tracked savings found in the annual report process. This difference is shown in this analysis for replicability with the 2018 annual report.

Electric Demand (kW) changes:

• Attachment PUC 1-51-2, Line 9. The 2016 Commercial & Industrial performance incentive would increase by \$65,844 under the 2020 proposed budget rules. This change is triggered because savings are under 100% of goal but the amount that savings fell short of 100% of goal was smaller than the amount by which expenditures were below 100%

of budget and the Company therefore would have received an increase in performance incentive earned relative to design level.

Natural Gas Energy (MMBtu) changes:

- Attachment PUC 1-51-3, Line 3. The 2018 Commercial & Industrial performance incentive would decrease by \$73,100 under the 2020 proposed budget rules. This change is triggered because savings were over 100% of goal but the amount that savings exceeded 100% of goal was smaller than the amount by which expenditures exceeded 100% of budget and the Company is therefore penalized through a reduction in performance incentive earned relative to design level.
- Attachment PUC 1-51-3, Line 4. The 2017 Income Eligible Residential performance incentive would increase by \$952 under the 2020 proposed budget rules. This change is triggered because of the overachievement of savings compared to goal while expenditures were kept below 100% (as opposed to the 95% of budget threshold in place in 2017).

		Comparison of Electric Energy (kWh) Performance Incentive for 2014 - 2018 with existing and proposed budget adjustment rules	c Energy (kWh) Perf	ormance Incentive f	or 2014 - 2018	with existing	and proposed	d budget adjus	tment rules

calculation method for earned performance incentive does not actually change due to the changes in budget rules.

B. In the 2014 program the electric performance incentive did not include a demand (kW) component. The electric performance incentive target was therefore set as 5% of budget upon achieving 100% of electric energy (kWh) savings. A. The 2018 Non-Income Eligible Residential actual earned performance incentive was manually adjusted downwards by \$3,347 in the 2018 Annual Report. The

PUC 1-52

Request:

What problems are addressed by the modifications to savings goals and budget adjustments used to calculate the earned shareholder incentive.

Response:

The proposed modifications to the savings goal and budget adjustment mechanisms used to calculate the Company's earned shareholder incentive are designed to address what have been characterized by stakeholders as two gaps in the current shareholder incentive model.

First, the current model does not incorporate a mechanism that links the Company's earned performance incentive to achievement of savings goals related to reduction in customer usage of delivered fuels. While costs associated with delivering these savings are incorporated into the eligible spending budget that determines the overall size of the performance incentive pool, the Company's actual performance incentive earnings each year are determined on the basis of achieved savings of only electric energy, electric passive demand, and gas. With the allocation of a specified portion of the overall performance incentive opportunity linked to the achievement of delivered fuels savings goals (as measured through the implementation of weatherization measures for customers who rely on delivered fuels for home heating, or who partially or completely displace delivered fuel consumption for heating purposes with air source heat pumps), the introduction of this delivered fuels component of the performance incentive mechanism adds a level of accountability for the Company for the achievement of these goals and their attendant contribution to state energy policy goals.

Second, the introduction of incremental budget adjustment mechanisms builds on existing performance incentive mechanisms, while addressing additional scenarios that are not addressed by the current mechanism. Specifically, under the current mechanism in place for 2019, the Company has an opportunity to increase earned performance incentive when exceeding savings targets at or below 95% of planned spending. Additionally, the Company's performance incentive earnings are reduced when spending exceeds 105% of budgeted levels while not achieving savings goals.

However, once the Company has achieved 100% or more of planned savings, there is no performance incentive-based mechanism to encourage the Company to manage spending. By introducing additional accountability for the Company when the proportion of over-spend relative to budget exceeds the proportion of achieved savings relative to target, this mechanism more completely aligns Company incentives with those of the customers funding these programs.

PUC 1-52, page 2

Similarly, the current mechanism reduces the Company's performance incentive earnings when spending exceeds budgets by more than 5% and savings goals are not achieved. However, the current mechanism does not create performance incentive-based mechanisms to encourage the Company to manage spending when spending falls below budgeted levels and savings goals are not achieved. The introduction of a symmetrical performance incentive adjustment mechanism in situations where the proportion of under-spend relative to budget exceeds the proportion of achieved savings relative to target savings introduces an incentive for the Company to manage program spending in these scenarios.

PUC 1-53

Request:

Referencing the Joint Testimony on Bates page 59, lines 19 to 20, please provide the supporting evidence that electrification of heating has greater uncertainty in savings. Please explain why this uncertainty is or is not commonly shared by the utility, ratepayers, and participants.

Response:

There are two primary drivers of greater uncertainty in savings for heating electrification measures relative to the more traditional mechanism through which Company savings performance is evaluated and compensated under the existing performance incentive mechanism: portfolio effects and the depth of data supporting the establishment of savings targets. Both of these are described in more detail below:

Portfolio effects: In the Company's existing performance incentive mechanism, savings performance is measured and determined at the sector (i.e. residential, income-eligible, C&I) level. By definition, this performance is derived from the implementation of dozens of measures and technologies. In any given year, any number of factors can influence market acceptance and adoption of any specific savings measure, technology or approach, and the existence of a portfolio of approaches within each sector provides the Company with the flexibility needed to adapt to market developments in the pursuit of maximum achievable savings and resulting benefits for customers. In the event that an unanticipated market development limits the Company's opportunity or ability to pursue a particular form of savings, this can be addressed, and sector level savings targets achieved, through the accelerated pursuit of alternative technologies or approaches that might develop faster than anticipated or represent an increased opportunity to achieve savings on behalf of customers. This diversity of potential approaches and pathways is the source of reduced uncertainty.

The portfolio of potential approaches available to achieve savings goals within the delivered fuels performance incentive carve-out is much smaller and is limited just to weatherization and the installation of air source heat pumps. This dependence upon just two measures creates uncertainty.

<u>Depth of supporting data</u>: Savings targets established under and linked to the current performance incentive mechanism are informed by a combination of years of performance data, participation data, existing evaluations on the market such as free ridership, spill over and residential participation, and market data and resource availability from vendors. All of these things are used to inform savings targets that are developed in conjunction with external stakeholders and validated by third-party experts.

PUC 1-53, page 2

In the case of the proposed air source heat pump targets in 2020, the availability of supporting data relative to other measures was more limited. A number of studies are currently underway, including a market adoption study being performed by a third-party consultancy on behalf of the Company as well as a technical potential study to inform air source heat pump targets in future plans. However, sufficient progress had not been made as of the time of goal-setting for the 2020 plan to inform these goals. Additionally, the air-source heat pump market, particularly when deployed as primary heating system with the goal of displacing existing delivered fuel-based heating systems, is relatively nascent, and the Company has only been providing incentives for the displacement of delivered fuels heating sources with air source heat pumps in Rhode Island since 2018. As a result, the depth of historical performance data to inform go-forward targets that are available for other measures with a longer performance history are not present.

The Company believes that, regarding the performance incentive mechanism as proposed, this uncertainty is appropriately shared between the Company, customers, and program participants. This is primarily a function of the fact that the performance incentive opportunity presented to the Company through the proposed delivered fuels carve-out mechanism is not incremental to the historical incentive pool, but rather, is carved out of an overall pool that continues to be set on the same basis as the overall pool in past years. Effectively, the Company has proposed shifting the achievement of a portion of the potential performance incentive pool from an area of lower savings uncertainty to an area of higher savings uncertainty.

The Company believes that external stakeholders recognized this shift and that the establishment of and support for wider performance bands (60% to 150%) under which the Company could earn a performance incentive (relative to the traditional 75%-125% band applied to the other savings pools that drive Company achievement of performance incentive) represents an appropriate sharing of this uncertainty between the Company and customers.

PUC 1-54

Request:

When are CHP projects included in Program Year targets and budgets and when are they included in actual Program Year review for the purposes of calculating National Grid's performance?

Response:

Anticipated costs and savings associated with CHP projects are included in the Program Year targets and budgets established during the Company's annual planning process and are included in budgets and savings targets included in the Annual Plans filed with the Rhode Island Public Utilities Commission. Typically, CHP projects are included in a specific Program Year's targets and budgets only after a customer has committed to the CHP project within that Program Year. CHP projects are also included in a specific Program Year's targets and budgets if there is a completed benefit screening for the project, the customer has received an offer letter, and there is a high probability of the project completing construction within the Program Year.

Annual savings resulting from installed CHP projects are included in the Program Year review for purposes of calculating National Grid's performance upon completion of the commissioning and post-inspection processes associated with each project.

Commissioning is the process following installation whereby the operating details of the technical assistance study and minimum requirements document (MRD) are verified. A minimum of 20% of the identified energy savings and incentives are included in the Program Year review after the commissioning process is completed.

Post-inspection is the process by which the Company ensures that an installed CHP project complies with the terms outlined in the project's MRD. The MRD contains engineering hardware and operational specifications that directly affect savings estimates. A maximum of 80% of the energy savings and incentives are included in the Program Year review in the year in which the post-inspection process is completed.

PUC 1-55

Request:

When are financing dollars (including on-bill repayment dollars) included in Program Year targets and budgets and when are they included in actual Program Year review for the purposes of calculating National Grid's performance?

Response:

The Company utilizes, and typically requests funding for, three distinct financing mechanisms in support of achieving planned savings in Energy Efficiency Plan submissions:

- Heat Loans
- Revolving Loan Funds (On-Bill Repayment)
- Rhode Island Infrastructure Bank.

Heat Loans:

Funds utilized in support of the Heat Loan financing mechanism are used to 'buy-down' interest charges that residential customers would typically make to private lenders in servicing loans associated with the installation of energy efficiency measures in their homes. Effectively, from the customer perspective, these buy-downs turn the loans into interest-free loans, while allowing customers to access and leverage external sources of capital in funding up-front investments required to achieve savings.

Estimated funds required to support the Heat Loan program are budgeted for the years in which interest payments are made to participating lenders on behalf of customers who have received loans. Actual spending in the program is tracked in the years in which payments are made to lenders.

No direct savings are associated with Heat Loans. Rather, savings are claimed on the basis of the installation of measures supported by the loan and are claimed in the Program Year in which the supported measure(s) is (are) installed.

Revolving Loan Funds (On-Bill Repayment):

Financing dollars for support of the on-bill repayment "financing" mechanisms are included in Company budgets in the years in which the Company plans to make injections into Revolving Loan Funds (also known as "On-Bill Repayment" funds) for customer financing of projects. Such funds are requested in years in which the Company believes that such injections will be

PUC 1-55, page 2

necessary to support sufficient availability of funds within the Revolving Loan Fund mechanism in order to meet customer demand for these loans, taking into account expectations around installation of measures that will rely on this support and anticipated recovery of capital back into the funds based on customer repayment of outstanding loans over the course of each calendar year.

Financing dollars injected into Revolving Loan Funds each year are reported each program year, during the year in which such injections are made.

As described above with the Heat Loan program, savings resulting from measures implemented by customers with the support of revolving loan fund financing are reported and included in Company calculations of achieved energy savings in the year in which those measures are post-inspected and paid.

Rhode Island Infrastructure Bank:

Transfers of ratepayer funds to the Rhode Island Infrastructure Bank (RIIB) are budgeted for during each year's planning cycle based on the demand for these funds as assessed by RIIB.

Actual expenditures associated with these transfers are tracked and reported during the program year in which such transfers are made.

As with the other financing mechanisms described above, the savings resulting from measures implemented on the basis of customer utilization of loan funds enabled by RIIB financing are reported and included in Company calculations of achieved energy savings in the year in which those measures are post-inspected and paid.

PUC 1-56

Request:

When are Rhode Island Infrastructure Bank (RIIB) dollars (including on-bill repayment dollars) included in Program Year targets and budgets and when are they included in actual Program Year review for the purposes of calculating National Grid's performance?

Response:

The Company's On-Bill Repayment (OBR) mechanisms for Large Commercial and Industrial customers, both electric and gas, are separate from the funds that are transferred to the Rhode Island Infrastructure Bank (RIIB) to support the Efficient Buildings Fund. Please see PUC 1-55 for more information regarding the Company's Revolving Loan Funds/OBR.

Transfers of customer funds to the Rhode Island Infrastructure Bank (RIIB) are budgeted for during each year's planning cycle based on the demand for these funds as assessed by RIIB.

Actual expenditures associated with these transfers are tracked and reported during the program year in which such transfers are made.

As with the other financing mechanisms the Company supports, the savings resulting from measures implemented on the basis of customer utilization of loan funds enabled by RIIB financing are reported and included in Company calculations of achieved energy savings in the year in which those measures are post-inspected and paid.

PUC 1-57

Request:

For each year since 2016, please provide the amount and date of any transfers of program dollars to the RIIB.

Response:

Please see the table below, which includes the amount and date of all transfers of program dollars to the Rhode Island Infrastructure Bank for each year beginning in 2016.

Year	Amount	Date of Transfer
2016	\$1,870,500	11/01/2016
2017	\$5,000,000	10/31/2017
2018	\$5,000,000	10/12/2018
2019	\$5,000,000	03/13/2019

PUC 1-58

Request:

For each year since 2016, please provide the following information about RIIB-financed projects in a table:

- 1. Rows should be each project or project segment financed by RIIB that was supported with Energy Efficiency program dollars.
- 2. Column indicating the year the date the project or project segment was selected for a loan
- 3. Column indicating the year the project or project segment was completed (went into service)
- 4. Column indicating the total loan for the project or project segment
- 5. Column indicating the portion of the project cost that will support installing measures that were part of National Grid's EE Plan in the year the project was selected
- 6. Column indicating the total disbursement for the project or project segment to-date
- 7. Column indicating the portion of the disbursements that supported installing measures that were part of National Grid's EE Plan in the year the project was selected
- 8. The total expected energy or demand savings (separating electric from gas from delivered fuels)
- 9. The portion of expected energy or demand savings that will come from measures that were part of National Grid's EE Plan in the year the project was selected
- 10. The total to-date energy or demand savings associated with completed (in service) project segments that were part of National Grid's EE Plan in the year the project was selected
- 11. The total actual budget expenditure used to support National Grid's reported actual budget for the purposes of calculating the shareholder incentive

Response:

This response was prepared in consultation with the Rhode Island Office of Energy Resources (OER) and the Rhode Island Infrastructure Bank (RIIB). Please reference Attachment PUC 1-58, which provides numerical answers to sub parts 1, 2, 3, 4, 6 and 8. The remaining sub parts are addressed herein.

The column headers in Attachment PUC 1-58 are explained in more detail below.

- 1. The column labeled "Round" refers to the Efficient Buildings Fund (EBF) borrowing round in which the municipality was scored "highly enough" by OER to be placed on the Project Priority List (PPL) and considered for an EBF loan. Not all municipalities that are listed on the PPL move forward to borrow money from RIIB.
- 2. The column labeled "Application #" refers to the number associated with the most granular level of data that National Grid tracks in its savings tracking system InDemand.
- 3. The column labeled "EE Loan Date" refers to the date and year that the municipality signed loan documents with RIIB.
- 4. The column labeled "Application Complete" refers to the year a National Grid incentive application was completed for a measure installed at a customer's property.
- 5. The column labeled "Year Claimed" refers to the year the measure is post inspected, paid, and claimed by the Company in its annual goals.
- 6. The column labeled "Total Loan" refers to the amount of money that a municipality has borrowed from the RIIB in a EBF Financing Round shown in the first column. This information is only available at the municipality level.
- 7. The column labeled "Disbursements to Date" refers to the amount of money that has been disbursed to a municipality by RIIB for eligible project costs up to August 15, 2019.
- 8. The column labeled "Savings (net kWh)" or "Savings (net therms)" refers to the amount of savings claimed by National Grid in the year listed in the "Year Claimed" column.

Because the Company does not have numerical answers to subparts 5, 7, 9, 10 and 11 as requested by the PUC, the Company has provided written explanations below addressing each subpart in turn.

Subpart 5

Column indicating the portion of the project cost that will support installing measures that were part of National Grid's EE Plan in the year the project was selected:

After consulting with its partners, the Company believes that all project costs are required for the safe and effective installation of energy efficiency measures and compliance with state and local laws. Funds borrowed by a municipality often include a "cost of issuance" which include the borrower's cost of bond council, financial advisors, and local council. According to RIIB this amount is typically not materially significant for these loans.

Subpart 7

Column indicating the portion of the disbursements that supported installing measures that were part of National Grid's EE Plan in the year the project was selected:

After consulting with its partners, the Company is not aware of any disbursements that support costs that are not defined as eligible costs. Eligible costs include energy efficient equipment, installation costs, cost of issuance, and additional engineering as needed. Related costs such as required asbestos remediation or temporary heating equipment if a HVAC is taken off line are also considered eligible costs. Eligible projects are discussed in OER Rule 300-RICR-00-00-1.8.

All applications that have been completed and claimed or are under construction are listed in the Company's Technical Reference Manual (TRM) or have been screened through the Company's Custom Screening Tool.

Subpart 9

The portion of expected energy or demand savings that will come from measures that were part of National Grid's EE Plan in the year the project was selected:

The savings being claimed by National Grid are located in the far-right column of Attachment PUC 1-58.

After consulting with its partners, the Company is not aware of any substantial additional kWh or therm savings related to completed measures that are not captured and claimed by National Grid. The Company is aware that new overhead doors were installed at public works facilities in West Warwick and Pawtucket and that there were some savings associated with their installation based on feedback from National Grid's municipal sales person and Project Summary Form (PSF) List updates, but has not received definitive information on the installation and energy savings of these doors from Clough Harbor and Associates (CHA) by the time this response was written. CHA is the engineering firm that conducts post-installation inspections for the EBF. There are no applications in National Grid's system of record for these two installations most likely because these installations did not pass National Grid's Cost/Benefit test and the Company was unable to pay an incentive for these doors.

Subpart 10

The total to-date energy or demand savings associated with completed (in service) project segments that were part of National Grid's EE Plan in the year the project was selected:

The savings being claimed by National Grid are located in the far-right column of Attachment PUC 1-58.

The Company asserts that the savings captured through National Grid's InDemand system account for the vast majority of savings being produced. Small amounts of non-claimable savings may be associated with the two overhead door installations highlighted in Subpart 9.

Subpart 11

The total actual budget expenditure used to support National Grid's reported actual budget for the purposes of calculating the shareholder incentive:

The Company included the amounts listed in PUC 1-57 as eligible spending when calculating each year's shareholder incentive. The Company intends to do the same in 2019.

PUC 1-59

Request:

Please provide a table for each year since 2016 that has the following information in columns for each year:

- The energy or demand savings National Grid expected from RIIB-financed efficiency projects broken out by fuel type
- The energy or demand savings National Grid included in its performance targets broken out by fuel type
- The energy or demand savings National Grid claimed to meet its performance targets broken out by fuel type
- The difference between claimed savings and targeted savings.

Response:

Please see Attachment PUC 1-59 for a table containing the requested information for plan years 2016 through 2019.

Please note the following comments about relevant elements of the table provided in Attachment PUC 1-59:

- Values displayed in Column (A) represent aspirational savings potential from Rhode Island Infrastructure Bank (RIIB) financed projects as described in prior year plan filings. These numbers reflect approximate savings that the RIIB and National Grid anticipated would be realizable over time if all of the potential projects under discussion were completed, evaluation impacts remained the same, and transferred dollars could be leveraged at the anticipated three to one leverage ratios. Particularly in initial years these savings estimates were clearly aspirational, and the Company believes that this year's estimates are more likely to prove accurate than those conveyed in previous years. However, this can only be assessed over time and in retrospect.
- Values displayed in Column (B) are 0 in each year as the Company does not develop or maintain a specific planning line item for savings that will result from Efficient Buildings Fund (EBF) transfers in any given year. There are two reasons for this:
 - o The Company sees the EBF as a tool that enables savings from municipalities and is considered when the Company estimates savings from municipalities and streetlights in each planning cycle. If savings do not materialize from

municipal or streetlighting projects the Company must make up for these savings in other initiatives or programs.

O As with other commercial and industrial financing mechanisms, the Company does not directly attribute savings to financing mechanism in planning or reporting. Rather, these financing mechanisms are individual components of a portfolio of enablers (other examples of these enablers include marketing spend and workforce development investments) that ultimately drive targeted and realized savings within specific programs but are difficult to reliably attribute to an anticipated pool of savings in any individual year.

2016 - Electric (kWh)

Energy savings described in plan (kWh)	Energy savings in perf. Target	Energy claimed (net kWh)	Difference between column B and C
Not stated	0	223,461	(223,461.00)

2016 - Gas (therms)

Energy savings described in plan (therms)	Energy savings in perf. Target	Energy claimed (net therms	Difference between column B and C
Not stated	0	2,128	(2,128.00)

2017 - Electric (kWh)

2019 - Gas (therms)

Energy savings described in plan	Energy savings in perf. Target	Energy claimed	Difference between column B and C
(therms)			
35,000	0	0	0
			Savings claimed as of 8/15/2019

PUC 1-60

Request:

Referencing National Grid's responses to 1-58 and 1-59, please provide any further evidence that the energy or demand savings National Grid claimed in order to meet its performance targets actually occurred in the years they were claimed to earn a shareholder incentive. For any year in which other measures were implemented to make up for lower-than-expected RIIB-financed savings, please explain how, if at all, National Grid made up for those missed savings.

Response:

Energy and demand savings reported for a given calendar year result from the installation and realization of energy saving measures that occurred during that calendar year.

Savings for all installed measures, regardless of the mechanism utilized to finance the installation of those measures, are verified through multiple mechanisms:

- Where appropriate, post-installation inspections are conducted in order to verify the correct and completed installation of measures prior to savings being claimed.
- Additionally, third party evaluation, verification & measurement experts conduct surveys or utilize other sampling methodologies in order to ensure the accuracy of energy and demand savings for installed measures at the portfolio level.

In each plan, the Company develops and proposes energy and demand savings goals for individual measures, programs, sectors, and portfolios through a collaborative stakeholder process. While these goals are informed by bottom-up analysis, review of data, and estimates of program and measure specific market opportunity based upon the best information available at the time that plans are developed, goals are fundamentally established, and managed during the course of each year, at the sector level.

In any given calendar year, some planned measures and programs realize energy and demand savings more quickly than planned, as market opportunities and customer appetite for measures develops more quickly than anticipated and the Company and implementation partners work to fully exploit those opportunities. Conversely, it is also not uncommon for specific measures or programs to develop less quickly than was anticipated during the planning process.

In line with this reality, in years when RIIB financed projects in the streetlighting and municipal building space have been slower to materialize than was hoped for during the planning process,

¹ See Attachment 10, Bates 560-564 for definitions of measures, programs, sectors, and portfolios.

the Company works to achieve its sector level savings goals through relying on the same approaches as would be employed when the market opportunity associated with any other measure or program develops less quickly than was hoped for during the planning process. The Company addressed this through consistently adapting to market conditions and pursuing alternative sector and program opportunities that are developing more quickly or showing higher potential for in-year savings than was anticipated during the planning process. For example, in 2017 and 2018 the Company saw greater than planned energy and demand savings achieved in the prescriptive lighting subprogram (E1 Light: Perspective), allowing the Company to achieve the commercial and industrial sector's overall energy savings goals despite RIIB financed projects producing less in-year energy savings than had been aspired to during the planning process.

PUC 1-61

Request:

Referencing Bates page 342 of the Plan, please provide the status of the development of the common reporting platform for the Efficient Buildings Fund.

Response:

Cadmus, an energy and environmental consulting firm working for the Rhode Island Infrastructure Bank (RIIB), has established an electronic file sharing platform to be used by the Rhode Island Office of Energy Resources (OER), RIIB, and the Company to securely exchange documents relevant to our joint work on the Efficient Buildings Fund (EBF).

The OER and RIIB have begun uploading documents to this platform, and the OER is concurrently developing a standardized file and organizational structure for collecting and storing these documents.

The Company will begin depositing documents to the system once the Company's Digital Risk and Security team certifies that the platform has been implemented in a manner that is compliant with Company standards given the nature of the data.

PUC 1-62

Request:

Referencing Bates pages 345 to 346 of the Plan, will the Company be injecting \$500,000 into the gas revolving loan fund? If so, please explain the first sentence on Bates page 346 of the Plan, which states that the Company is "still considering requesting an injection into this fund."

Response:

Yes, the Company will be injecting \$500,000 into the gas revolving loan fund. The entire paragraph at the top of Bates page 346 should have been deleted because it is language from a prior version of the Plan.

PUC 1-63

Request:

Please provide the total amount of money ratepayers have provided to support the RIIB and the total amount of money RIIB has loaned for energy efficiency projects.

Response:

Ratepayers have provided a total of \$16,870,447 to support the Efficient Buildings Fund (EBF). As of November 25, 2019, the Rhode Island Infrastructure Bank (RIIB) has loaned out \$18,100,003 to support energy efficiency projects.
