

Information Request AG-4-1

Request:

Refer to Exh. NG-JNC-3, at 12. "To replace the economically driven capacity retirements across ISO-NE, Black & Veatch assumed generic combined cycle units to be constructed at various locations across New England over the latter half of the analysis period."

- a. List the additions of all new generation capacity that is assumed to enter into service in the PROMOD scenarios "Base" and "With ANE" cases, including reference name, size, fuel-type (including if it is dual-fuel), heat rate, location, gas pipeline servicing it, and in-service date.
- b. Provide dispatch information for each of these units on an hourly basis, including energy margins.

Response:

- a. Please see Attachment AG-4-1(a) (Highly Sensitive Confidential Information) for the new generic combined cycle units assumed in the analysis. The units remain unchanged between the Base and With ANE case.
- b. Please see Attachment AG-4-1(b) (Highly Sensitive Confidential Information) for the annual dispatch and energy margin information for each of the generic combined cycle units assumed in the analysis for the Base and With ANE case.

Information Request AG-4-2

Request:

Exh. NG-JNC-3, at 20, references the "Integrated Market Modeling process" and the GPCM model is referenced at page 9. Please provide the following in the format used as inputs into the GPCM model for each scenario reported by Black & Veatch:

- a. A complete list of natural gas pipelines and maximum delivery capacity assumed in GPCM for all gas pipelines or pipeline corridors modeled for each of the "Base" and "With ANE" scenarios;
- b. List of natural gas pipelines delivering into New England assumed in GPCM;
- c. Maximum transfer capability of natural gas pipelines delivering into New England assumed in GPCM;
- d. Delivery receipt and final delivery points for natural gas pipelines delivering into New England;
- e. Monthly load factors for each pipeline delivering into New England projected by GPCM for the "Base" and "With ANE" scenarios; and
- f. Monthly demand for natural gas by New England end-users, detailed by residential, commercial, industrial and generators for the "Base" and "With ANE" scenarios.

Response:

- a. Please see Exhibit CLF-1-10, which lists the relevant regional natural gas pipeline capacities into New England assumed in the Base and With ANE scenarios.
- b. Please see Exhibit CLF-1-10 for the list of existing natural gas pipelines delivering into New England assumed in GPCM.
- c. Please see Attachment – AG-4-2(a) (Highly Sensitive Confidential Information), for the assumed maximum transfer capability of existing natural gas pipelines delivering into New England. These transfer capabilities remain unchanged between the Base Case and With ANE scenario.

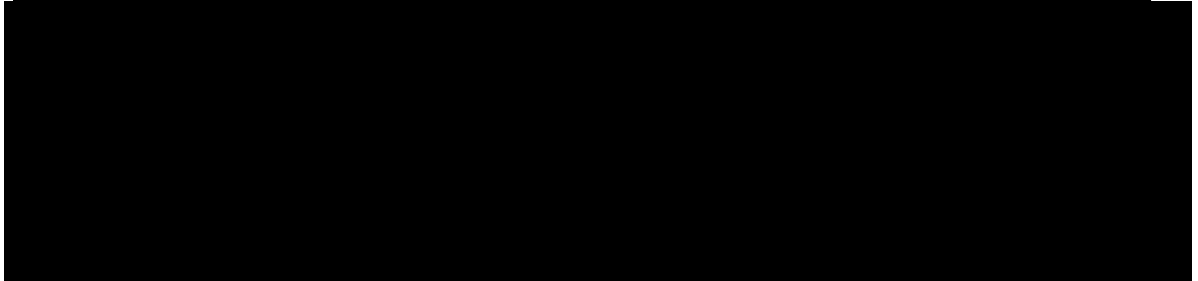

- d. Please see the table below for the initial receipt and final delivery points for existing gas pipelines delivering into New England. Please see the Company's response to Information Request AG-4-3 for details on the ANE project.

Pipeline	Initial Receipt Point	Final Delivery Point
Algonquin Gas Transmission	Lambertville – TETCO Interconnect	Beverley/Salem
Iroquois Gas Transmission	Waddington – TCPL Interconnect	South Commack
Maritimes and Northeast Pipeline (US)	Baileyville - M&NE Canada Interconnect	Dracut
Portland Natural Gas Transmission System	Pittsburg – TQM Interconnect	Dracut
Tennessee Gas Pipeline	Texas Gulf Coast	Dracut

- e. Please see Attachment AG-4-2(b) (Highly Sensitive Confidential Information) for the average monthly load factors for existing pipelines delivering into New England for the 2019-2038 analysis period.
- f. Please see Attachment CLF-1-18(a) (Highly Sensitive Confidential Information) for monthly demand in New England for residential, commercial, and industrial end-users, which remain unchanged between the Base and With ANE scenarios. Please see Attachment NEER-1-1(c) (Highly Sensitive Confidential Information)) for the monthly gas demand for power generation for the Base and With ANE scenario.

Information Request AG-4-3

Request:

Please explain how ANE was modeled in the "With ANE" case.

- a. Explain where the endpoints of the additional ANE pipeline capacity are modeled.
- b. Does the GPCM model run "With ANE" assume an additional 500 Bcf/day of pipeline capacity between Transco Zone 6 and Algonquin?
- c. Is there any additional pipeline capacity built in the "With ANE" scenario other than ANE? If so, please describe in full and provide all supporting documentation and workpapers.

Response:

- a. As stated in the ANE RFP response, the ANE Project starts at Mahwah, at the interconnect with the Tennessee Gas Pipeline and can serve power generators in Maine and New Hampshire directly connected to Maritimes & Northeast Pipeline past the Beverly interconnect. The ANE Project can deliver gas to the Maritimes & Northeast Pipeline, reaching the terminus of the project at the Bucksport Power Plant in Hancock, Maine.
- b. In the With ANE only scenario, no additional capacity is assumed between Transco Zone 6 and Algonquin.
- c. When compared to the Base Case, there is no additional pipeline capacity built in the With ANE scenario, other than the ANE Project.

Information Request AG-4-4

Request:

Please provide the underlying discount curves or relationship algorithms in GPCM that calculate natural gas prices at:

- a. Algonquin;
- b. Transco Zone 6;
- c. Iroquois ;
- d. Dracut; and
- e. Other natural gas delivery points priced in the GPCM model in the northeast (e.g., TETCO M-3, Dominion South) and Henry Hub.

If the discount curves or relationship algorithms are not available, please describe how GPCM balances supply and demand to determine a price.

Response:

a-e.. Generally, the GPCM model balances supply and demand from all the regions to find an equilibrium solution that maximizes producer profit and minimizes consumer cost. To find a market clearing solution, GPCM will dispatch lower cost supplies before more expensive ones and customers willing to pay more will be served before those willing to pay less. Supplies from the supply region will continue to be transported to the consumption regions until either the price differentials between the two regions drops below the transportation cost or the transportation capacity between the two regions is exhausted. The resulting prices, consumption and production quantities will represent market equilibrium.

Information Request AG-4-5

Request:

Please provide historical data since 2002, or at the earliest date available, on natural gas pipeline capacity released by National Grid LDCs into the secondary market, including:

- a. The quantity of unused pipeline capacity released for resale on a daily basis;
- b. The amount of unused pipeline capacity sold in the secondary market on a daily basis;
- c. The price National Grid LDCs received for pipeline capacity sold in the secondary market by transaction on a daily basis; and
- d. The portion of revenues received from the pipeline capacity resale that was passed through to natural gas customers on an annual basis.

Response:

- a.-d. Attachment AG-4-5 captures the readily available data for the gas off-system sales and pipeline capacity release transactions executed by National Grid's Gas LDCs for FY2014 through FY2016. The data includes the jurisdiction, the gas off-system sales volume and margin, the pipeline capacity release margin and the total margin. The pipeline capacity release volume is not readily available. Below is a summary of the National Grid Gas LDCs that operate in each jurisdiction that are captured in Attachment AG-4-5.

- Attachment AG4-5, at 1: Downstate New York (DSNY): Brooklyn Union Gas Company d/b/a National Grid NY and KeySpan Gas East Corporation d/b/a National Grid
- Attachment AG-4-5, at 2: Upstate New York (UNY): Niagara Mohawk Power Corporation d/b/a National Grid
- Attachment AG-4-5, at 3: Massachusetts (MA): Boston Gas Company d/b/a National Grid and Colonial Gas Company d/b/a National Grid
- Attachment AG-4-5, at 4: Rhode Island (RI): The Narragansett Electric Company d/b/a National Grid

The portion of margins returned to natural gas customers from the gas off-system sales and pipeline capacity release transactions varies by jurisdiction. In New York, 85% of margins are returned to natural gas customers. In Massachusetts, 90% of margins are

Information Request AG-4-6

Request:

Please indicate:

- a. All dates on which a National Grid LDC located in New England and/or New York has had its rights to firm pipeline capacity curtailed, and explain the reason(s) for curtailment; and
- b. All dates on which a National Grid LDC located in New England and/or New York has had to curtail its firm capacity customers and explain the reason(s) for curtailment.

Response:

- a. The Company requested from Algonquin Gas Transmission, Dominion Transmission Inc., Iroquois Gas Transmission System, Tennessee Gas Pipeline, Texas Eastern Transmission and Transcontinental Gas Pipeline Company to provide instances when primary firm capacity was curtailed. Below is a list of occurrences when primary firm capacity was curtailed.
 - a. Algonquin Gas Transmission
 - i. None
 - b. Dominion Transmission Inc.
 - i. None
 - c. Iroquois Gas Transmission System
 - i. None
 - d. Tennessee Gas Pipeline
 - i. January 14-18, 2014 – Compressor at Station 254
 - e. Texas Eastern Transmission
 - i. January 7, 2014 – Delmont Force Majeure
 - ii. November 18, 2014 – Line 16 Force Majeure
 - iii. January 6-15, 2015 – Entriiken & Chambersburg Force Majeure
 - iv. April 29, 2016 to date – Delmont Force Majeure
 - v. June 17, 2016 – Line 16 Force Majeure
 - f. Transcontinental Gas Pipeline
 - i. June 11, 2015- Lycoming, PA line failure
 - ii. January 12, 2016 – Station 515 High system utilization

As per pipeline terms and conditions a "curtailment" occurs when the pipeline determines that there is insufficient capacity to provide all the transportation service that has been scheduled to flow on a particular day. A pipeline cannot sell more firm capacity than it can guarantee it can deliver on a design day otherwise it wouldn't be firm capacity. An LDC's primary responsibility is to provide a reliable supply of natural gas to its firm customers and cannot risk a curtailment of supply. In planning for a design winter season and design day, an LDC develops a portfolio of assets which ensures firm deliverability on the coldest days. This combination of the pipeline not selling more capacity than it knows it can deliver and an LDC contracting for sufficient capacity to meet the coldest day is why curtailments are a rare occurrence.

Secondary in path and out of path capacity, which is used to supply those generators without firm capacity, is curtailed daily and are too numerous to list here. Each pipeline posts critical notices daily which list the location of the curtailment and the restriction quantity.

- b. Over the past five years there has only been one instance when any of the six National Grid LDCs have needed to curtail on system firm customers. On January 5, 2016 one generator in the KeySpan Energy Delivery Long Island service territory was curtailed due to insufficient minimum inlet pressures to the plant. An issue with the output from the Holtsville LNG facility did not allow the Company to maintain sufficient line pressure to feed the plant.

Information Request AG-4-7

Request:

Refer to Exh. JNC-3, at 13. Black & Veatch states that “expects the Distrigas terminal in Everett, Massachusetts, to continue to receive LNG cargoes similar to recent historical levels . . . with peak winter sendout of approximately 250 MMcf/d.” Please provide the following:

- a. All workpapers, analyses and spreadsheets supporting Black & Veatch's expectations, including public reports issued by Black & Veatch;
- b. Historical deliveries of LNG from Everett into New England for the past ten years (or however long data is available) on a daily and monthly basis;
- c. Historical daily peak deliveries of LNG from Everett into New England for each month; and
- d. Input assumptions used in each GPCM scenario analyzed by Black & Veatch in the format input into the model (e.g., daily, weekly or monthly for the period analyzed) regarding the maximum supply available from Everett and the associated supply curve and/or marginal cost of production.

Response:

- a. Black & Veatch assumed that projected Everett LNG terminal sendout would be similar to recent historical observed send-out volumes. While the Everett terminal has a maximum daily vaporization quantity well above the assumed sendout volumes, the historical observed volumes are more reflective of the current attractiveness of the New England market as an LNG import destination market.
- b. Please see Attachment-AG-4-7(a) for historical deliveries of LNG from Everett into New England on a daily and monthly average basis. The information provided is from the interstate pipeline electronic bulletin boards.
- c. Please see Attachment-AG-4-7(a) for the daily peak deliveries of LNG for each month. The information provided is from the interstate pipeline electronic bulletin boards.
- d. Please see Attachment NEER-1-11(a) (Highly Sensitive Confidential Information) for the monthly projected sendout at Everett. Black & Veatch assumed that Everett LNG

supply costs would be inframarginal, as the current LNG supply at the projected volumes to the Everett LNG facility are part of a long-term supply agreement, where these committed LNG supplies would be delivered and sold at the market price, irrespective of global LNG market prices. The assumed LNG supply cost would only include the variable O&M fees, commodity charges, and fuel use at the LNG terminal, which is below the market prices provided in NEER-1-3(a). These assumptions did not change between the Base Case and the With ANE Only scenario.

Information Request AG-4-8

Request:

Refer to Exh. JNC-3, at 12-13. Black & Veatch states that it “utilizes a basin-by-basin, play-by-play approach to assess the productive capacity, availability, and cost of major natural gas supply sources in North America. . . . The continued decline in Eastern Canadian production coupled with Nova Scotia and New Brunswick consumption will further limit M&NE pipeline imports to New England.” Please provide the following:

- a. A description, including any and all supporting documents, studies or analyses, on Black & Veatch's analyses and monitoring of Sable Island Offshore Energy Project production, including:
 1. Historical Sable Island Offshore Energy Project production back to 2002 or for the time period available;
 2. Projected production of Sable Island Offshore Energy Project input into its natural gas production models such as GPCM; and
 3. Output from Black & Veatch natural gas production models projecting Sable Island Offshore Energy Project production.
- b. A description, including any and all supporting documents, studies or analyses, on Black & Veatch's analyses and monitoring of Deep Panuke production, including:
 1. Historical Deep Panuke production back to 2002 or for the time period available;
 2. Projected production of Deep Panuke input into its natural gas production models such as GPCM; and
 3. Output from Black & Veatch natural gas production models projecting Deep Panuke production.
- c. A description, including any and all supporting documents, studies or analyses, on Black & Veatch's analyses and monitoring of Nova Scotia and New Brunswick consumption, including:
 1. Historical consumption levels back to 2002 or for the time period available;

2. Projected consumption levels; and
 3. Assumed demand for natural gas from Nova Scotia and New Brunswick for the scenarios Black & Veatch reference in Exhibit NG-JNC-3.
- d. A description, including any and all supporting documents, studies or analyses, on Black & Veatch's analysis and monitoring of Bear Head and other Canadian export facilities, including:
1. Historical and projected imports of LNG at Canaport back to 2002 or for the time period available;
 2. Projected exports of LNG from Eastern Canada;
 3. Amount of demand for natural gas by Canadian LNG export facilities assumed and/or projected by GPCM in Black & Veatch's scenarios; and
 4. Assumptions regarding any build-out of natural gas pipeline capacity through New England required to meet Eastern Canada's LNG export requirements.

Response:

- a. The Sable Island Offshore Energy ("SOEP") Project began production in late 1999 and reached its peak in production in 2002. Currently, the SOEP project is currently producing on average 142 MMcf/d in 2016.
 1. Please see Attachment AG-4-8(a) for the historical SOEP Project production.
 - 2-3. Please see Attachment AG-4-8(b) (Highly Sensitive Confidential) for the projected input and output production of the SOEP project.
- b. The Deep Panuke production began in August 2013 and reached its peak in early 2014. Production has steadily fallen since, and it is currently producing 47 MMcf/d on an average annual basis.
 1. Please see Attachment-AG-4-8(a) for the historical Deep Panuke Production.
 - 2-3. Please see Attachment-AG-4-8(b) (Highly Sensitive Confidential Information) for the projected input and output production of the Deep Panuke project.
- c. Nova Scotia and New Brunswick gas consumption has steadily grown since 2002, from averaging approximately 38 MMcf/d to approximately 182 MMcf/d by 2016.

1. Please see Attachment-AG-4-8(a) for the historical consumption for Nova Scotia and New Brunswick
 - 2-3. Please see Attachment-AG-4-8(b) (Highly Sensitive Confidential Information) for the projected demand for Nova Scotia and New Brunswick.
- d. Black & Veatch did not assume any LNG export volumes from Eastern Canada in this analysis. While there are several proposals in various development stages to export LNG from Eastern Canada, Black & Veatch did not include them in this analysis.
1. Please see Attachment-AG-4-8(c) for the historical imports of LNG at Canaport
 - 2-4. In the Base Case and With ANE scenario, Black & Veatch did not assume any projected exports of LNG from Eastern Canada, or any additional gas pipeline capacity through New England required to serve Eastern Canadian LNG export terminals.

Information Request AG-4-9

Request:

Refer to Exh. JNC-3, at 13. Discussing LNG Import Assumptions, Black & Veatch states, "[t]hereafter, imports at Canaport will be expected to be driven by arbitrage opportunities based on spot price expectations. Black & Veatch does not expect significant LNG import volumes at Canaport, Neptune, or Northeast Gateway beyond 2017."

- a. Please provide the basis for these statements, including all workpapers, underlying analyses, and spreadsheets.
- b. Please confirm that Black & Veatch's position is that the Base scenarios "without ANE" do not create any arbitrage opportunities based on spot price expectations to justify any LNG imports at Canaport, Neptune, or Northeast Gateway after 2017.
- c. Please explain whether Black & Veatch's natural gas model:
 1. assumes zero supply from LNG import facilities other than Everett, thereby constraining the system so that there are no LNG imports from Canaport, Neptune or Northeast Gateway after 2017; or
 2. projects no LNG imports from those facilities due to lack of arbitrage opportunities between global LNG prices and natural gas prices in New England, with and without ANE.

Response:

- a. Black & Veatch's assumptions regarding Canaport, Neptune and Northeast Gateway are based on our observations of recent historical import volumes at each terminal, and the current attractiveness of the New England market as an LNG import destination market.
- b-c. Based on the current global LNG market environment and the absence of meaningful firm contracted LNG import volumes at these import terminals, Black & Veatch did not expect significant LNG imports at Canaport, Neptune and Northeast Gateway beyond 2017.

Information Request AG-4-10

Request:

Please provide the following input assumptions used in each PROMOD/GPCM scenario analyzed by Black & Veatch for the "Base" and "With ANE" cases in the format input into the model (e.g., daily or weekly for the period analyzed):

- a. Natural gas prices;
- b. Coal prices;
- c. Oil prices;
- d. Canadian hydroelectricity prices;
- e. New York energy prices; and
- f. Demand for electricity in New England on an hourly basis.

Response:

- a. Please refer to Attachment NEER-1-3(a) for the relevant monthly natural gas prices used in the analysis for the Base Case and With ANE case.
- b. Please see Attachment AG-4-10(a) (Highly Sensitive Confidential Information) for the coal prices used in the analysis. The coal prices remain unchanged for the Base Case and With ANE case.
- c. Please refer to Attachment NEER-1-1(i) (Highly Sensitive Confidential Information) for the oil price assumptions used in the analysis. The oil prices remain unchanged for the Base Case and With ANE case.
- d. Black & Veatch's responses are limited to the New England area given the limited relevance of information regarding power markets outside of New England.
- e. Please refer to Attachment CLF-1-5(a) (Supplemental) (Highly Sensitive Confidential Information) for the monthly New York electric prices.

- f. Please refer to Attachment NEER-1-1(f) for the monthly electric load projections by zone in ISO-NE. The electric load remains unchanged for the Base Case and With ANE case.

Information Request AG-4-11

Request:

Refer to Exh. NG-JNC-3, at 25, fn. 6. Please provide any and all workpapers and analyses supporting why Black & Veatch's use of a 7.06 percent discount rate (National Grid's weighted average cost of capital) is appropriate for both costs and benefits of the ANE expansion.

Response:

Exhibit NEER-2-59 explains why Black & Veatch used a 7.06 percent discount rate and explains the discount rate sensitivity analysis presented in the Appendix of Exhibit NG-JNC-3.
